New Gold - Rainy River Mine  
Ammonia Emissions**

**INCO Reactor Tank**

**Process Description**

The INCO reactor tank is used to destroy residual amounts of cyanide present in solution following leaching and CIP. Trace ammonia emissions from this source are expected, since the INCO cyanide detoxification is effective at removing cyanide from the process effluent; the ammonia present in the effluent is not involved in the reaction, and remains in solution and prone to entrainment in the air exhaust since the INCO reactor is an aerated vessel (0.76 m<sup>3</sup>/s air). The air flowrate has been estimated based on scaling a previous study for 6000 tpd to 24000 tpd mill.

**Emission Methodology - Engineering Calculation**

Air emissions were estimated based upon an estimated ammonia concentration of 1 ppm in the exhaust.

**Data Quality**

The data quality is considered to be marginal. The concentrations of ammonia in the exhaust are based upon the potential concentrations of this parameter in solution and the corresponding concentrations expected in the exhaust gas.

**Sample Calculation**

$$\text{Concentration (mg/m}^3\text{)} = \text{Concentration (ppm)} \times \text{Molecular Weight (g/mol)} / \text{Molar Volume} \quad \text{eq. 19}$$

$$\text{Concentration (mg/m}^3\text{)} = (1 \text{ ppm}) \times (17.031 \text{ g/mol}) / (24.45 \text{ L})$$

$$\text{Concentration (mg/m}^3\text{)} = 0.697$$

$$\text{Emission Rate (g/s)} = \text{Concentration (mg/m}^3\text{)} \times \text{Flow Rate (m}^3\text{/s)} \times 1 \text{ q/1000mg} \quad \text{eq. 20}$$

$$\text{Emission Rate (g/s)} = (0.697 \text{ mg/m}^3) \times (0.76 \text{ m}^3\text{/s}) \times 1 \text{ q/1000 mg}$$

$$\text{Emission Rate (g/s)} = 0.00053$$

**Electrowinning (CN Destruction)**

**Process Description**

The electrowinning cells produce a gold and silver sludge from pregnant solutions (CIP circuit and gravity concentration). Barren solution is stored in tank (exhausted through Source ID EF5) prior to recycling back into the carbon stripping stage.

**Emission Methodology - Engineering Calculation**

Engineering calculation based on process design and reaction chemistry. The emission rates were calculated based on basic reaction chemistry. Physical data was estimated from preliminary plant design and data estimated from other mills.

**Data Quality**

The data quality is considered to be marginal.

**Assay Lab Dust Collectors**

**Dust Collectors**

**Process Description**

The dust collector is used for the collection of airborne dust and particulate, during the operation, contaminated air enters the dust collectors through the dirty air inlet area and passes through the filter cartridges.

**Baghouse Emissions Methodology - Emission Factor**

Per ESDM Procedure Document, an emission factor of 0.01 grains/ft<sup>3</sup> or ~20 milligrams per cubic metre (mg/m<sup>3</sup>) of gas can be assumed at the outlet of a fabric filter dust collector. In cases of sites with multiple baghouse (also known as fabric filter dust collectors) discharging simultaneously, an emission factor of 20 mg/m<sup>3</sup> can be assumed for the most significant dust collector and 10 mg/m<sup>3</sup> for the remaining units.

**Data Quality**

Emission rate estimates that are developed from tests on a moderate to large number of sources where the source category population is sufficiently specific to minimize variability (e.g., US EPA, AP-42, emission factor quality rating of A or B) are anticipated to provide above-average quality of emission rate estimates.

**Sample Calculation**

$$\begin{aligned} \text{Emission Rate - DC1 (g/s)} &= \text{Baghouse Outlet Concentration (mg/m}^3\text{)} \times \text{Stack Flow Rate (m}^3\text{/s)} \times (1 \text{ g} / 1000 \text{ mg)} && \text{eq. 33} \\ \text{Emission Rate - DC1 (g/s)} &= (10 \text{ mg/m}^3\text{)} \times (3.54 \text{ m}^3\text{/s)} \times (1 \text{ g} / 1000 \text{ mg}) \\ \text{Emission Rate - DC1 (g/s)} &= 3.54\text{E-02} \end{aligned}$$

**Assay Lab**

**Process Description**

The Assay lab utilize chemicals for purpose of research. Only open bottles are stored under the fume hoods, others are stored in the storage cabinet. The storage, handling and use of these liquids are carried out in the lab and are exhausted through an exhaust on the roof.

**Methodology: Engineering Calculation (EC)**

This equation (provided by staff of the ministry, Environmental Monitoring and Reporting Branch), used to approximate evaporation rates from spills, open tanks, drums or pools. Assuming 100% is volatilized for consevatism

**Sample Calculations**

**Evaporation Equation**

$$Q = (8.5 \times 10^{-10}) \times A_p \times P^* \times M \times (u)^{0.78} \text{ (kg/s at 293 K or 20 degrees Celsius)}$$

Where; Q = evaporation rate (vapour release rate), kg/s at 293 K or 20°C

A<sub>p</sub> = pool area, in square metres = 0.0254 m container opening

P\* = partial vapour pressure (this can be estimated from the liquid mole-fraction), Pascal's

M = molecular weight, (summation of individual element molecular weights)

u = wind speed, metres per second = 1 m/s

A typical container where the solvents will be stored has a diameter of 1.5 inch ( 0.152 m).

$$\begin{aligned} A_p \text{ (m}^2\text{)} &= 2 \times \pi \times r^2 \\ &= \pi \times ((1.5/39.37)/2)^2 \\ &= 2.28\text{E-}03 \end{aligned}$$

<sup>1</sup> Since weight % was not provided in the SDS, a conservative assumption of 100% was made

<sup>2</sup> Where vapour pressure not available, 7.5mmHg is assumed.

<sup>3</sup> Since Fly ash, Bone ash, Sodium Borate, Leco Cell, and Copper Oxide Rare Earth Base are solids, it was assumed that Suspended Particulate Matter gets emitted. Emissions are based on the assumptions that 100% of the average of the calculated emissions are released to the atmosphere.

<sup>4</sup> Used Clausius-Clapeyron Equation to estimate the vapor pressure of gold at 20C

**Calculation of Vapour Pressure:**

Known vapour pressure (Gold) = 7.5E-03 mm Hg (P1) at 1373C (1646.15K) (T1)

Use Clausius-Clapeyron Equation to estimate vapour pressure at 25C (273 K) (T2)

$\ln(P2/P1) = -DH_{vap}/R * (1/T2 - 1/T1)$  (Enthalpy of vaporisation of gold is 324 kJ/mol)

$\ln(P2/7.5E-03) = -324 \text{ kJ}/8.31 \text{ kJ/mol K} * (1/273-1/1646.15)$

$\ln(P2/7.5E-03) = -0.119$

$P2/7.5E-03 = 0.89$

$P2 = 0.007 \text{ mm Hg}$

**Sample Calculations: Eq-32**

$$\text{Sodium Lauryl Sulfoacetate 1hr (g/s)} = \left( \frac{((8.5 \times 10^{-10}) \cdot A_p(m^2) \cdot P(Pa)) \cdot M(g/mol) \cdot u(m/s)}{1000} \right) \\ = \left( \frac{((8.5 \times 10^{-10}) \cdot 3.65e-02(m^2) \cdot 1.98e-06(Pa)) \cdot 330.42(g/mol) \cdot 1(m/s)}{1000} \right) \\ = 2.62E-09 \text{ g/s}$$

**Caustic Loading**

**Process Description**

Bulk sodium hydroxide is delivered to the site in tanker trucks where the sodium hydroxide is unloaded into the storage tank. Unloading of sodium hydroxide into the storage tanks is expected to generate emissions. Loaded carbon is washed with a dilute HCl acid solution to remove inorganics prior to the caustic wash. Caustic is added to spent HCl acid in the acid wash tank which is equipped with an exhaust (Source ID EF4). The site has a caustic storage tank which receives solution by tanker truck (Source ID EF8). Carbon stripping involves washing loaded carbon with a higher strength, pressurized hot caustic cyanide solution, to produce a high strength pregnant (gold bearing) solution. The process is at ambient temperature and is located approximately 2.7 km from the property line. Fugitive emissions are expected from the process of loading hydrochloric acid tanks due to air displacement of potentially acid containing vapours.

**Emission Methodology - Emission Factor & Engineering Estimation**

Emission factor obtained from Table 1 FACTORS FOR TOXIC AIR CONTAMINANTS OF CONCERN TO THE METAL FINISHING INDUSTRY, developed by the Metal Finishing Association of Southern California and the South Coast Air Quality Management District.

**Tank Dimensions**

Diameter (m) 18  
 Height (m) 21

The HCl calculations were based on Equation 4 from Australia's Emission Estimation Technique Manual for Alumina Refining. This calculation is given a data quality of average. Emissions were based on a fill rate of 28 t over a period of 1.5 hr.

$$\text{Emission Rate, } E = 0.042 \times MW \times V \times (\text{Vol\%/}100) \quad \text{eq. 28}$$

Where:

- E = Mass of acid emitted during filling (kg)
- MW = Molecular weight of acid (g/mol)
- V = Volume of vapour space or volume of acid added (m<sup>3</sup>)
- Vol% = Partial vapour pressure (kPa) divided by ambient pressure of 101.3 kPa

**Data Quality**

Emission rate estimates that are developed from tests on a reasonable number of facilities where the source category population is sufficiently specific to minimize variability (e.g., US EPA, AP-42, emission factor quality rating of C) are anticipated to provide average quality emission rate estimates.

**Drilling and Blasting**

**Process Description**

Ore is extracted from the open pit and underground mine by drilling and blasting. Drilling occurs at 111 holes per 12 hr shift. Blasting uses a maximum emulsion of 95 tonnes and a maximum blast area of based on 111 holes, 5 m x 5 m with 171 mm diameter holes within the Open pit which is limited to hours between 11:00 AM and 5:00 PM (6 hours/day). During the winter (i.e., Dec, Jan and Feb) blasting occurs between 4:00 PM and 5:00 PM (1 hour/day) and is restricted to 75,000 kg/blast.

Emulsion is a commonly utilized bulk explosive product that can be used for lateral development and can also be pumped both up and down into stoping blastholes. Emulsion is water resistant, produces low levels of ammonium nitrate in leachate, can be handled in bulk deliveries to reduce costs, has reliable and consistent performance and, depending on the product, can be left in the ground for up to four weeks before firing. Bulk emulsion is proposed as the primary explosive product to be used for both lateral development and stoping (uphole and downhole) at Rainy River.

**Hydrogen Cyanide Emissions**

**Process Description**

Cyanide is used in the leach stage of gold ore processing, and is typically added at a rate of 0.5kg NaCN per tonne of ore. Gravity concentrate is leached in an intense cyanidation reactor, to produce a pregnant solution laden with gold (in solution). The cyanide bonds with gold to form an Au (CN)<sub>2</sub><sup>-</sup> complex allowing the gold to be extracted through adsorption onto activated carbon granules or cementation with zinc powder. Lime is used to buffer the slurry pH to optimise cyanide in solution levels and minimise the formation of HCN gas. The pH in the reactor is maintained at a pH > 11.0 to minimize hydrogen cyanide (HCN) emissions. The site has 8 leach tanks where oxygen and sodium cyanide are added to the slurry in an alkaline environment (pH > 11.0) to prevent cyanide at lower pH from volatilizing to the atmosphere within the mill building. Potential emissions of hydrogen cyanide from the mixing tank are exhausted and emissions from the leach tanks are fugitive. Following leaching, the solution is pumped to 7 Clean In Place (CIP) tanks. Gold dissolved in the cyanide solution is adsorbed onto activated carbon in the CIP circuit for a total retention time of approximately 115 minutes. Potential emissions of hydrogen cyanide from the CIP tanks are fugitive.

**Emission Methodology - Engineering Estimation**

HCN emissions from process tanks were calculated using the equation from Australia's NPI Emission Estimation Technique Manual for Gold Ore Processing, Version 2.0.

Note:

Volatilisation of HCN accounts for 90% of the natural degradation of cyanide from tailings and is pH dependent as a result of the HCN/CN<sup>-</sup> flux. At a pH>11 the percentage of natural degradation due to volatilisation is expected to be 0% but as a conservative estimate 10% is estimated.

**Sample Calculation**

HCN emissions from tanks (g/s) =  $([0.013 \times \text{HCN}_{(aq)}] + 0.46) \times A \times T \times 0.96 \times 1/10^3) \times 1,000 \text{ g/kg} \times 1\text{d}/24 \text{ hr} \times 1 \text{ hr}/3,600 \text{ sec}$   
 where,

$$[\text{HCN}_{(aq)}] = [\text{NaCN}] \times 10^{(9.2 - \text{pH})} \quad \text{eq. 11}$$

[NaCN] = Concentration (as mg/l) of NaCN in the leach/adsorption tank

pH = pH in the leach/adsorption tank

A = Surface area (m<sup>2</sup>) of the leach/adsorption tank

T = Period of emissions (hours)

**Aggregate Material Handling & Processing**

**Process Description**

Activities at the quarries include excavation, crushing (one crushing and screening plant may be located at any of the operating pits at any given time), and material handling. Particulate emissions are calculated from fine aggregate which has been crushed and screened or sand and gravel operations where the raw material already contains fines. Ore and mine rock are mined below the water table and as such are wet as mined.

**Emission Methodology - Emission Factor**

U.S. EPA AP 42 - Ch. 11.19.2 Crushed Stone Processing and Ch. 11.24 (based on high moisture > 4%)

Aggregate handling is limited to 10 hours per day.

Controlled sources (with wet suppression) are those that are part of the processing plant that employs current wet suppression technology similar to the study group.

**Ore Material Handling & Crushing**

**Crushing and Material Loading/Unloading Processes Controlled by Baghouse Dust Collector**

**Process Description**

Higher grade ore from the pit and underground mine is trucked directly to the processing plant for crushing. The primary crusher building houses the gyratory crusher, surge pocket, apron feeder, and the tail end of the stockpile feed conveyor. The primary crusher has a design capacity of 1,500 tonnes per hour (tph) and is equipped with a dust collection system to control emissions from screening and crushing. Ore from the open pit is delivered by truck and dumped directly into one of two dump pockets which feed into the primary crusher. The ore unloading transfer point is a source of fugitive emissions. Crushed material is conveyed to the crushed ore stockpile as another transfer point and source of fugitive emissions. Oversized material is reduced in size by a rock breaker. Emissions from the conveyor drop under the stockpile are controlled by a dust collector.

**Emission Methodology - Emission Factor**

From Table C-2: Summary of some useful equations and general guidance of the ESDM Procedure Document : An emission factor of 0.01 grains/ft<sup>3</sup> or ~20 milligrams per cubic metre (mg/m<sup>3</sup>) of gas can be assumed at the outlet of a fabric filter dust collector. In cases of sites with multiple baghouse (also known as fabric filter dust collectors) discharging simultaneously, an emission factor of 20 mg/m<sup>3</sup> can be assumed for the most significant dust collector and 10 mg/m<sup>3</sup> for the remaining units.

**Fugitive Material Loading & Unloading Processes**

**Process Description**

Emissions from initial ore loading and unloading are fugitive from the open pit to the haul trucks and unloading from the haul trucks to the dump pocket in the primary crusher building and unloading to the various sized ore stockpiles. Crushed material from the primary crusher building is discharged via a conveyor which directs material to the crushed ore stockpile.

Mill Process and Miscellaneous Sources**

**CN Destruction**

**Process Description**

The cyanide destruction area is located outside the main processing building. Following the leaching process, gold that is dissolved in the cyanide solution is adsorbed onto activated carbon in the CIP circuit. Loaded carbon is transferred to the gold recovery circuit while tailings from the CIP circuit are sent to the cyanide destruction tanks (Source ID HCND).

Liquid sulphur dioxide (SO<sub>2</sub>) is received and transferred by a closed loop system to sealed tanks. A SO<sub>2</sub>/air process is used for in-plant treatment of tailings in the cyanide destruction tank where cyanide and metallo-cyanide complexes are oxidized to cyanate ion using copper sulphate as a catalyst. Emissions from loading of copper sulphate and mixing are controlled by a dust collection system (Source ID DC6). The cyanate then reacts with water to form ammonia and carbon dioxide. Free metal ions are precipitated with the addition of lime to form insoluble metal hydroxides and will adsorb onto tailings particle solids, eventually settling out of the slurry in the tailings management area. Excess SO<sub>2</sub> is used in the process to ensure complete stoichiometric oxidation of cyanide. It was assumed excess SO<sub>2</sub> is emitted fugitively from the destruction tank (Source ID HCND).

The cyanide destruction process is detailed in the following reactions:

NaCN Usage	0.5	kg/t ore feed
Excess SO <sub>2</sub> usage	0.7%	percentage
Annual ore processing rate	9,855,000	tonnes/year

**Emission Methodology - Mass Balance**

SO<sub>2</sub> is consumed as part of the CN Destruction process. The excess SO<sub>2</sub> is used to ensure that the reaction is complete. All excess SO<sub>2</sub> has been considered to be discharged to the atmosphere.

**Data Quality**

The data quality is considered to be above average as a mass balance approach was used that assumes all excess SO<sub>2</sub> is discharged to the atmosphere.

**Sample Calculation**

Emission Factor  
(g/s/tonnes of ore processed) = NaCN usage (kg NaCN/tonne of ore) x Molar ratio (kg SO<sub>2</sub>/kg NaCN) x (1 year/365 days) x (1 day/24 hours) x (1 hour/3600 seconds) x (1000g/kg) x 0.7% excess eq.12  
 = 0.5 (kg NaCN/tonne of ore) x (64.07/49.01)(kg SO<sub>2</sub>/kg NaCN) x (1 year/365 days) x (1 day/24 hours) x (1 hour/3600 seconds) x (1000g/kg) x 0.7% excess  
 = 1.45E-07

Emission Rate (g/s) = Emission Factor (g/s/tonnes of ores processed) x Annual ore processing rate (tonnes/year) / No. of cyanide destruction tanks  
 4.15E-07 (g/s/tonnes of ore processed) x 9,855,000 (tonnes/year) / 2 (tanks)

**Emission Estimation**

**Lime Bin Baghouse**

**Process Description**

Calcium oxide is received in a storage bin and emissions from handling are controlled by a cartridge bin vent (Source ID DC4). The lime slaker converts calcium oxide to calcium hydroxide with the addition of water to produce a slurry. Lime is used to control pH in the leach tanks (this optimizes cyanide ion solution levels and minimizes formation of hydrogen cyanide gas as well as pH control in the cyanide destruction circuit).

**Induction Furnace**

**Process Description**

Metal impurities in the ore charged to the induction furnace include very low copper content, and potentially minor amounts of zinc and iron. Only a minor quantity of particulate matter would be generated from the pouring operation. The dust collection system is designed to capture all fumes from the induction furnace and casting, as the exhaust may contain trace quantities of valuable gold and silver which can be recovered from the filters. These impurities are predominately taken up in the slag and were therefore considered to be insignificant emissions from the dust collector exhaust. Flux is mixed into the sludge and the resulting mixture is dried and smelted in the induction furnace. Emissions from the furnace are controlled by a dry cartridge filter (Source ID DC3).

Molten precious metals are poured into moulds to form doré bars.

**Pebble Crushing Area**

**Process Description**

Oversized material from the SAG slurry passes through a pebble crusher before being returned to the SAG mill. The slurry is pumped from the milling circuit to a cluster of cyclones. Emissions from the pebble crushing area are controlled by a wet scrubber system (Source ID EF1).

**Copper Sulphate Dust Collector**

**Process Description**

Liquid sulphur dioxide (SO<sub>2</sub>) is received and transferred by a closed loop system to sealed tanks. A SO<sub>2</sub>/air process is used for in-plant treatment of tailings in the cyanide destruction tank where cyanide and metallo-cyanide complexes are oxidized to cyanate ion using copper sulphate as a catalyst. Emissions from loading of copper sulphate and mixing are controlled by a dust collection system (Source ID DC6).

**Flocculant**

**Process Description**

Flocculant is added to the thickener feed in the pre-leach thickener feed. Emissions from the addition of flocculant are controlled by a baghouse dust collector (Source ID DC5).

**Sodium Metabisulphate Loading**

**Process Description**

A dust collector has been installed to handle emissions associated with the handling of sodium metabisulphite at the Gold Recovery Area.

**Baghouse Emissions Methodology - Emission Factor**

Per ESDM Procedure Document, an emission factor of 0.01 grains/ft<sup>3</sup> or ~20 milligrams per cubic metre (mg/m<sup>3</sup>) of gas can be assumed at the outlet of a fabric filter dust collector. In cases of sites with multiple baghouse (also known as fabric filter dust collectors) discharging simultaneously, an emission factor of 20 mg/m<sup>3</sup> can be assumed for the most significant dust collector and 10 mg/m<sup>3</sup> for the remaining units.

**Data Quality**

Emission rate estimates that are developed from tests on a moderate to large number of sources where the source category population is sufficiently specific to minimize variability (e.g., US EPA, AP-42, emission factor quality rating of A or B) are anticipated to provide above-average quality of emission rate estimates.

**Sample Calculation**

$$\text{Emission Rate (g/s)} = \text{Baghouse Outlet Concentration (mg/m}^3\text{)} \times \text{Stack Flow Rate (m}^3\text{/s)} \times (1 \text{ g} / 1000 \text{ mg eq. 13})$$

$$\text{Emission Rate (g/s)} = (20 \text{ mg/m}^3\text{)} \times (1.9 \text{ m}^3\text{/s)} \times (1 \text{ g} / 1000 \text{ mg})$$

$$\text{Emission Rate (g/s)} = 0.0190$$

**Propane Heating**

**Process Description**

Propane heaters are located throughout the process building for comfort heating (Source ID SPACEHEAT). Propane is also used to heat ventilation air in the underground mine and combustion emissions are vented through the two portals (Source ID PORT1, PORT2).

**Emission Methodology - Emission Factor**

Per the ESDM Procedure Document, only NOx was considered to a significant contaminant from the combustion of propane. Emissions from the combustion of propane were estimated using emission factors in U.S. EPA P-42 Chapter 1.5

Emission Factor	13	lb/1000 gal.

**Data Quality**

The data quality is considered to be marginal as the emission factor has a rating of 'E'.

**Road Dust Emissions**

**Process Description**  
Haul road traffic dust generated emissions from onsite access roads and pipelines, power infrastructure and fuel storage facilities. For site haul roads, a control efficiency of 98% was used to reflect dust suppression by watering or chemical dust suppressant application, setting and enforcing speed limits for haul trucks, and the use of aggregate with lower silt content for road construction and maintenance. The lower silt content on the roads is a result of hard mine rock being used for the haul roads instead of softer limestone gravel often used in pits and quarries.

**Emission Methodology - Emission Factor**

Based on AP42 Chapter 13.2 Unpaved Roads for taconite mining  
The predicted air quality impacts of emissions of silica as a constituent of respirable dust (PM10). The range of quartz contents within the rock of the Rainy River deposit is similar to that observed for common granite rocks, which have quartz contents that range from 20% to 60%. These types of granitic rocks are significant component of the rock found throughout northern Ontario. Data from other, similar sites were used to calculate the silica content of the fine fraction. A silica concentration of 7.5% of the PM10 was used in the modelling, based upon the findings of an extensive Ministry of Labour (MOL) study conducted at eight underground mines in northern Ontario (Verma et.al., Respirable Dust and Respirable Silica Exposure in Ontario Gold Mines, Journal of Occupational and Environmental Hygiene, February 2014, pp. 111-114). The ratio of silica in the total PM10 fraction from the MOL study was applied to the PM10 emissions from the site to calculate the predicted silica concentrations.

- up to 98% for haul road watering or dust suppressant application;
  - up to 80% for limiting truck speeds, and;
  - up to 50% for road surface improvements.

Emission rate estimates that are developed from tests on a moderate to large number of sources where the source category population is sufficiently specific to minimize variability (e.g., US EPA, AP-42, emission factor quality rating of A or B) are anticipated to provide above-average quality of emission rate estimates.

**Sample Calculation**

**Step 1:** Calculation of lb/VKT (from AP42 - Chapter 13.2.2)  
 $E \text{ (lb/vkt) (for TSP)} = k \times (\text{silt } \%/12)^a \times (\text{mean weight}/3)^b$  (see values for k, a, b above)  
 $= 4.9 \times (5.8/12)^{0.7} \times (316/3)^{0.45} = 24 \text{ lb/VKT}$  eq. 15

**Step 2:** convert to kg/VKT  
 $E \text{ (kg/VKT)} = 281.9 \text{ g/VKT} \times 24 \text{ lb/VMT}/1000 \text{ g/kg} = 6.65 \text{ kg/VKT}$  eq. 16

**Step 3:** total VKT is obtained from distance travelled x number of round trips per hour x 2.  
Total VKT = 1500 m x 56 round trips per hour x 1000 m/km = 84 VK travelled in an hour.

**Step 4**  
Total emission rate (kg/hour) = 84 VKT/hour x 6.65 kg/VKT = 558.24 kg/hour

**Step 5**  
558.24 kg/hour x 1000 g/kg / 3600 s/hour = 155.07 g/s

**Step 6**  
Controlled emission rate (g/s) = 155.07 g/s x (1 - efficiency) = 155.07X (1- 0.98) = 3.10 g/s eq. 17

**Process Description**

Repairs to vehicles and heavy machinery such as loaders are carried out at the Maintenance Shop. Exhausts are fugitive.

**Emission Methodology - Emission Factor**

Welding emisisions were calculated using U.S. EPA AP-42 emission factors for electric arc welding using E7018, E70S, and E71T electrodes.

**Data Quality**

Emission rate estimates that are developed from tests on only a small number of facilities where there is evidence of variability within the source category population (e.g., US EPA, AP-42, emission factor quality rating of D or E) and/or the emission factor rating is uncertain are considered to have uncertain data quality.

**Sample Calculation**

PM emissions from SMAW (g/s) = Maximum SMAW Electrode Usage (kg/day) x Emission Factor (g/kg) x 1 (day/24 h) ;eq. 26

**Process Description**

Stockpiles of overburden, run of mine ore, low-grade ore and mine rock are expected to have fugitive emissions due to wind erosion in addition to the Tailings Management Area (TMA).

**Emission Methodology - Emission Factor**

The Australian NPI Emission Estimation Technique Manual for Mining Version 3.0 provides a factor of 0.4 kg/ha/hr for TSP. The SPCC (1983) average value for wind erosion is 0.4 kg/ha/hr (3,504 kg/ha/year). It is suggested that this value be adopted as a default in the absence of other information.

Waste Water Treatment Plant**

**Process Description**

TMA water is pump from Pumphouse 25 to the Reactor outside the WTP. The water decants from the Reactor into 4 clarifiers. The clean water from the clarifiers flows into a common 24" line and flows by gravity to Nitrification Cell 1. The sludge from the clarifiers drops out the bottom into a common line and is pumped back to the TMA. A lime solution from the Lime Storage Tank is injected into the 24" line just prior to the Reactor for PH control. Dry Lime from a silo is transferred by an auger into the Storage tank and mixed/agitated to create the Lime solution. Ferric Sulphate from the Ferris Sulphate Storage Tank is injected into the 24" line just prior to the Reactor as a coagulant. Pol-e-z Polymer is transferred from a 1m3 tote in alternating batches into two Polymer storage tanks. The Polymer is added to each of the 4 clarifiers as a flocculant. Dry Soda Ash is transferred by an auger into a Soda Ash Solution Storage Tank where it is mixed/agitated with clean water from the WMP. The Soda Ash Solution is pumped into Nitrification Cell 3 to provide Alkalinity Control. Water from Nitrification Cell 4 is transferred to BCR1 by a pump. MKP is injected into the Transfer line to BCR1. Glycerin is injected into the Transfer line to BCR1. Water from BCR1 decants into outlet grates and flows by gravity to the WMP. All operations take place within the building facility.

## Respirable dust and respirable silica exposure in Ontario gold mines.

Verma DK<sup>1</sup>, Rajhans GS, Malik OP, des Tombe K.

### Author information

### Abstract

A comprehensive survey of respirable dust and respirable silica in Ontario gold mines was conducted by the Ontario Ministry of Labor during 1978-1979. The aim was to assess the feasibility of introducing gravimetric sampling to replace the assessment method which used konimeters, a device which gave results in terms of number of particles per cubic centimeter (ppcc) of air. The study involved both laboratory and field assessments. The field assessment involved measurement of airborne respirable dust and respirable silica at all eight operating gold mines of the time. This article describes the details of the field assessment. A total of 288 long-term (7-8 hr) personal respirable dust air samples were collected from seven occupational categories in eight gold mines. The respirable silica ( $\alpha$ -quartz) was determined by x-ray diffraction method. The results show that during 1978-1979, the industry wide mean respirable dust was about 1 mg/m<sup>3</sup>, and the mean respirable silica was 0.08 mg/m<sup>3</sup>. The mean% silica in respirable dust was 7.5%. The data set would be useful in future epidemiological and health studies, as well as in assessment of workers' compensation claims for occupational diseases such as silicosis, chronic obstructive pulmonary disease (COPD), and autoimmune diseases such as renal disease and rheumatoid arthritis.

Based on the FLSmidth PSD distributions, the P98 for this material would be 300 mm and there is little to no material accounted for between 330-400 mm. Also the P100 of the material with Wi values of 14 kWh/t and 18 kWh/t are below the design of 350 mm.

#### CERTIFIED POWER RATING

- Each engine is factory tested to verify power and performance.
- FM-UL power ratings are shown at specific speeds, Clarke engines can be applied at a single rated RPM setting ± 50 RPM.

#### ENGINE RATINGS BASELINES

- Engines are to be used for stationary emergency standby fire pump service only. Engines are to be tested in accordance with NFPA 25.
- Engines are rated at standard SAE conditions of 29.61 in. (752.1 mm) Hg barometer and 77°F (25°C) inlet air temperature [approximates 300 ft. (91.4 m) above sea level] by the testing laboratory (see SAE Standard J 1349).
- A deduction of 3 percent from engine horsepower rating at standard SAE conditions shall be made for diesel engines for each 1000 ft. (305 m) altitude above 300 ft. (91.4 m)
- A deduction of 1 percent from engine horsepower rating as corrected to standard SAE conditions shall be made for diesel engines for every 10°F (5.6°C) above 77°F (25°C) ambient temperature.

NOTES:

- All dimensions are in inches and may vary  $\pm 3/8"$ .
- Not for construction purposes, unless certified.
- Caution: The driveshaft is designed to operate at a  $2^\circ$  angle with the input and output shafts in parallel. The engine crankshaft is to be set with a parallel offset of "B"  $\pm 0.10$  inches vertically above the pump shaft and  $0.00" \pm 0.10$  inch parallel offset horizontally right or left of the pump shaft. Refer to the Certified Driveshaft Instructions Manual for alignment instructions.
- Pump suction and discharge flanges are ANSI Standard flat face.
- Left-hand (counterclockwise) rotation is not available.
- Optional: base mounted controller (not shown) add 25" to "HB" (length of base) and 2 additional  $\phi 1.00 \times 2.00$  slots.

### Raw Exhaust Engine Noise \*\*

RPM	BHP	OVERALL dB(A)	Octave Band									
			31.5 Hz dB(A)	63 Hz dB(A)	125 Hz dB(A)	250 Hz dB(A)	500 Hz dB(A)	1k Hz dB(A)	2k Hz dB(A)	4k Hz dB(A)	8k Hz dB(A)	16k Hz dB(A)

\* Values above are provided at 3.3ft (1m) from engine block and do not include the raw exhaust noise.

\*\* Values above are provided at 23ft (7m), 90 ° horizontal, from a vertical exhaust outlet and does not include noise created mechanically by the engine.

The above data reflects values for a typical engine of this model, speed and power in a free-field environment.

Installation specifics such as background noise level and amplification of noise levels from reflecting off of surrounding objects, will affect the overall noise levels observed. As a result of this, Clarke makes no guarantees to the above levels in an actual installation.

#### CERTIFIED POWER RATING

- Each engine is factory tested to verify power and performance.
- FM-UL power ratings are shown at specific speeds, Clarke engines can be applied at a single rated RPM setting ± 50 RPM.

#### ENGINE RATINGS BASELINES

- Engines are to be used for stationary emergency standby fire pump service only. Engines are to be tested in accordance with NFPA 25.
- Engines are rated at standard SAE conditions of 29.61 in. (752.1 mm) Hg barometer and 77°F (25°C) inlet air temperature [approximates 300 ft. (91.4 m) above sea level] by the testing laboratory (see SAE Standard J 1349).
- A deduction of 3 percent from engine horsepower rating at standard SAE conditions shall be made for diesel engines for each 1000 ft. (305 m) altitude above 300 ft. (91.4 m)
- A deduction of 1 percent from engine horsepower rating as corrected to standard SAE conditions shall be made for diesel engines for every 10°F (5.6°C) above 77°F (25°C) ambient temperature.

NOTES:

- All dimensions are in inches and may vary ±3/8".
- Not for construction purposes, unless certified.
- Caution: The driveshaft is designed to operate at a 2° angle with the input and output shafts in parallel. The engine crankshaft is to be set with a parallel offset of "B" ± 0.10 inches vertically above the pump shaft and 0.00" ± 0.10 inch parallel offset horizontally right or left of the pump shaft. Refer to the Certified Driveshaft Instructions Manual for alignment instructions.
- Pump suction and discharge flanges are ANSI Standard flat face.
- Left-hand (counterclockwise) rotation is not available.
- Optional: base mounted controller (not shown) add 25" to "HB" (length of base) and 2 additional Ø1.00 x 2.00 slots.

## Scania Stage IV / Tier 4 Final Technology

Scania industrial engines meet the requirements of Stage IV and Tier 4 Final without the need for a particulate filter. With only EGR and SCR technology, the installation will be unaffected. Scania-developed systems for engine management and emission control ensure an attractive blend of performance and operating economy. The function of the SCR system is based on the injection of a urea solution (AdBlue or DEF, Diesel Exhaust Fluid) into the after-treatment system. With EGR, a small amount of exhaust gases is returned to the intake of the engine, diluting the intake air and reducing the oxygen concentration. This will reduce the combustion temperature and further reduce emissions.

For extended life across most quarrying applications. Super tooth has a significantly increased wear life using a deeper profile without comprising strength or product shape.

### Quarry Tooth Jaws

Quarry jaws are suitable for use in medium rock, hard rock and high abrasion applications. Will provide a longer wear life due to the additional material on the teeth of the jaw. (Minimum CSS is 50mm)

### Heavy Duty Jaws

New design of HD jaw plate for the fixed jaw. Designed to work with other profiles on the swing jaw. Aimed to bring the wear in line with the swing jaw and reduce the amount of liner changes required.

### Pyramid Tooth Jaws

Designed as a Jaw for recycling applications or with rock that is difficult to fracture.

## Under Crusher Deflector Plate

A hydraulic adjustable deflector plate, increases belt protection on recycling applications. Situated immediately below the crusher outlet point & is fitted with a 15mm thick wear resistant plate. Deflector plate working angle can be adjusted from the PLC control system.

# THE METALFAB BIN ACTIVATOR

Metalfab engineers have been involved with the design of bin activators from the time of their conception to their more sophisticated present day design.

Through years of testing and innovation, our skilled engineers have developed the Metalfab Bin Activator, a unique system that eliminates the problems associated with the design and performance of other bin activators.

Metalfab Bin Activators are built to withstand the repetitive forces of vibration and forces induced by the product load above them.

The unit's true conical shape is efficient for promoting flow of product with minimum force requirements. This reduction in force means minimum horse power consumption, which results in lower operating costs for users. Plus, it adds to the life of the unit.

The primary baffle is cone shaped to provide maximum motion to the product. This self-cleaning baffle is supported by tubular cross members, which provide the required strength to support product head loads. It gives stiffening strength which accepts the force produced by the

vibrator and also provides a proper welding surface for securing the baffle.

Metalfab is the only manufacturer of bin activators that has a secondary adjustable baffle. With other bin activators, often the force required to activate product in the bin is in excess of the force required to discharge product from the bin activator outlet. When this happens, the product compacts, jams and flow stops. The Metalfab secondary baffle is suspended from the cross members which support the primary baffle. The lower section of the suspension member is a threaded rod which allows the baffle to be adjusted vertically.

Because of the Metalfab suspension system, the secondary baffle moves at a different amplitude than that of the bin activator body. Therefore, it creates motion in the product at the outlet and allows product to flow freely. In essence, it acts as a bin activator within a bin activator.

The flexible connection between the stationary section and the vibrated section is of neoprene construction (as standard). It is  $\frac{7}{16}$ " thick with three plies of nylon reinforcement made in an endless configuration. Externally the sleeve is 50 durometer and has two raised edges which prevent the sleeve from slipping out from under the clamps.

Internally it is 30 durometer construction which allows it to seat firmly on  $\frac{3}{16}$ " dia. beads welded to the bin activator rings.

The clamps holding the sleeve are 1" wide x 16 gage stainless steel strapping with telescopic type take-ups. This allows for take-up with no pinching of the sleeve. Multiple take-ups are used to achieve equal clamping of the sleeve.

The suspension system is designed to take the head load of product on the bin activator, allowing it to move freely through its vibrator amplitude. In addition, it maintains the bin activator on center. The system consists of a solid

block of steel with holes bored in each end at 90° to each other. Vibration isolators are pressed into the holes and hardened bolts fasten the suspension arms to the bin activator. Because of the 90° bolting, the bin activator cannot be forced off center. This eliminates the possibility of the flexible sleeve being loosened and product being lost from the bin.

The vibrator or power source for the Metalfab Bin Activator is a unitized design. It is a motor equipped with oversized roller bearings and is built to withstand the rigors of vibration. Eccentric weights are clamped to the motor shaft. There are two weights on either side of the motor which allow force settings from 0 to

maximum in stepless increments. A calibrated dial is fixed to the weights to provide ease of adjustment. The weight sections are covered with cast or spun covers secured by bolts and have an "O" ring seal.

All Metalfab Bin Activators are supplied with a mounting ring which can either be welded or bolted to the bin. This arrangement allows for factory welding of all mounting brackets which maintains alignment of the support system.

Metalfab Bin Activators are available in carbon steel, stainless steel and a wide variety of coatings.

## Unique Metalfab design features.

Solid steel hanger arm.

Machined hole is perfectly round. Allows for equal rubber contact throughout.

Forgings or castings have crowns in the center.

Remains on center, even under abnormal load conditions.

Parallel bolted arms can act like a pendulum under abnormal load conditions.

### Steel block hanger arms

Since the hanger arms which link the bin activator to the bin proper must carry the combined weight of the bin activator itself and the material in the bin while under vibration, it is essential that the arms be designed and fabricated of the most durable, and dependable materials.

To provide maximum strength under the most severe operating conditions Metalfab hanger arms are made from a solid block of steel up to 3 1/2" square, rather than cast or forged. Bushing holes are machined through the steel and then press fitted with an isolator, providing a large area of rubber to steel contact for maximum vibration isolation.

Unlike forgings or castings, these machined holes have no "crowns" which cause the isolator to extrude, and require frequent replacement. In addition, isolators are arranged at 90° to each other, in order to assure positive alignment of the bin activator from excessive movements, which could lead to material leakage or metal-to-metal contact.

### Durable, continuous sleeve

3 ply, continuous sleeve

The sleeve which seals off the gap between the Metalfab bin activator and the non-vibrating mounting ring is designed to elim-

inate spillage or the release of fine particles into the air. The sleeve being 7/16" thick, with three plies of reinforcement, it is virtually puncture proof. Raised edges on the endless sleeve prohibit it from being pulled out from under the clamps.

Raised edges prevent leakage

Metalfab's unmatched design provides for long sleeve life. Special flanged and bolted sleeve arrangements are available for pressures to 14.9 PSI.

Special flanged/bolted sleeve arrangement

### Unitized vibrator motor

The Metalfab vibrator motor assembly consists of both the motor itself and an eccentric weight system packaged into a single, ruggedly built dual voltage unit which is designed to give years of trouble-free service.

The Metalfab vibrator motor assembly consists of both the motor itself and an eccentric weight system packaged into a single, ruggedly

The heavy duty, spherical, roller-type bearings are sealed—eliminating the need to remove the unit from the area when making force adjustments. The four eccentric weights are clamped directly to the specially designed motor shaft and can be adjusted, in place, in stepless increments.

All components are completely enclosed. All motors are unconditionally guaranteed for thirty months. Explosion-proof units are also available.

# Screw Conveyor Safety Practices

TO AVOID UNSAFE OR HAZARDOUS CONDITIONS, THE FOLLOWING MINIMUM PROVISIONS MUST BE STRICTLY OBSERVED.

- 1.(A) **SCREW CONVEYORS SHALL NEVER BE OPERATED UNLESS THE CONVEYOR HOUSING COMPLETELY ENCLOSES THE CONVEYOR MOVING ELEMENTS.** All necessary housings, covers, safety guards, railings, gratings and power transmission guards must be in place. If the conveyor is to be opened for inspection, cleaning or observation, the motor driving the conveyor is to be locked out electrically in such a manner that it cannot be started by anyone, however remote from the area unless the conveyor housing has been closed and all guards are in place. **THE HOUSINGS, COVERS AND GUARDS ARE NECESSARY TO PREVENT ANYONE FROM ENTERING, REACHING, OR FALLING INTO THE MACHINERY, WHICH MAY RESULT IN SERIOUS PERSONAL INJURY.**
- (B) If the conveyor must have an open housing as a condition of its use, the **entire open conveyor is then to be guarded by a railing, fence or rugged safety grating.**
- (C) Feed openings for shovel, front end loader or other mechanical equipment shall be constructed in such a way that the conveyor is covered by a rugged grating. If the nature of the material is such that a grating can't be used, **then the exposed section of the conveyor is to be guarded by a railing and there shall be warning signs posted.**

2. **DO NOT PLACE HANDS OR FEET IN ANY CONVEYOR OPENING, TO AVOID BEING CAUGHT BETWEEN THE ROTATING CONVEYOR SCREW AND THE CONVEYOR HOUSING.**
3. **DO NOT WALK ON CONVEYOR COVERS OR GRATINGS OR POWER TRANSMISSION GUARDS, TO AVOID FALLING INTO OR AGAINST THE ROTATING CONVEYOR SCREW.**
4. **DO NOT** poke or prod material in the conveyor with a bar or stick, **to avoid being struck by the bar or stick.**
5. **DO NOT** overload conveyor or use it for anything but its intended use.
6. **DO** practice good housekeeping

### SHORT DELIVERIES AND LOW CAPITAL COST

**Sepro Tyre Drive Grinding Mills** are a reliable solution for small and medium capacity grinding applications, and are suitable for Ball, Rod and Pebble charges. Mills come complete with a variable frequency drive (VFD) package which allows you to fine tune the operation of the mill based on the charge and application. No auxiliary drive is required to perform maintenance, which is done quickly with minimal heavy lifting due to the simple removal of the grate or discharge head to access the mill internals. Sepro Mill shells are manufactured in one piece to high quality standards and are thermally stress relieved to eliminate localized high stress areas.

The machine utilizes the Sepro Pneumatic Tyre Drive System (PTD) which provides an alternative to standard trunnion supported mills. This system of rubber tyres mounted on independent gear boxes provides excellent serviceability and reliability, having been well proven in numerous difficult applications. An instrumental feature accompanying Sepro's tyre driven equipment is the tyre pressure monitoring system (TPMS) which comes standard with each Sepro rotary control console.

**Pilot scale mills are also available for pilot plant and laboratory use.**

## DRAFT INDUCERS

For creating an instant, reliable draft with boilers, furnaces, heaters, ovens, incinerators, kilns and other combustion equipment.

## INDUSTRIAL EXHAUSTERS

For venting corrosive, adhesive, moisture and stock laden air, explosive fumes and gasses from all types of environments up to 2000°F.

# Quincy Draft

# Draft Inducers

Quickdraft units create an instant draft for any type of heating, incineration or combustion equipment. By establishing the most favorable conditions for combustion, the draft inducers increase efficiency, reduce fuel consumption and enhance clean burning.

Motors, blades, bearings...in fact, all moving parts...are external to the air/gas/fume stream. Accordingly, they are all unaffected by smoke, abrasive ash, high temperatures or other adverse factors and conditions.

## Standard

Models Q4 through Q10 including Q4S and Q8S use fractional horsepower motors with sleeve bearings, 115V, 1-phase, 60Hz.

## Commercial

1/4 to 10 horsepower motors operating at 1725 rpm. Face mounted up to 7 1/2 HP. Power requirements adapted to the application.

## Problem Solvers

Where a Quickdraft draft inducer has not been installed initially, the units have been added to correct for these typical problems:

- Chimney flues which are too small, too short, or cold at start up.
- Flues which are too large, causing excessive cooling because of recirculation.
- Blow-backs on startup.
- Smoke pipes which are too long, or have too many elbows.
- Surrounding high hills, trees, or buildings which cause turbulence.
- Excessive smoke leakage around clean-out and inspection doors.
- Excessive soot buildup in passes and breeching.
- The necessity to increase chimney or stack capacity when larger equipment is installed.

## Principle of Operation

As depicted in the illustration, air is injected at high velocity through a plenum chamber controlled by a nozzle into an eductor tube. This action induces the flow of air/gas/fumes/vapors upstream from the tube. Flue gasses, for example, are then entrained with the injected air and exhausted into the chimney or stack. **NOTE:** There are no obstructions to flow in the Quickdraft eductor tube and all moving parts are external to the flow path.

## Industrial

1/2 to 40 horsepower motors operating at 3450 rpm. Face mounted up to 7 1/2 HP. Motor base mounts over 7 1/2 HP. Power requirements adapted to the application.

# Draft Inducer

Quickdraft units provide the means for promoting complete burning in virtually any combustion application. The capability of the draft inducer is engineered to overcome the resistance created by wet scrubbers, spray washers, afterburners or other devices added to the combustion process.

## Range of Sizes

Quickdraft units are available in sizes ranging from 4" to 42" inlet diameter.

## Custom Engineered Units

In addition to the Quickdraft Standard, Commercial and Industrial models, custom engineered units are available with motors from 1/30 HP to 500 HP.

## Eductor Materials

Standard materials for the Quickdraft eductor include vitreous enameled steel and 304, 309 or 316 stainless steel. Other materials are available to meet application requirements.

## Versatility

All models can be installed either horizontally or vertically. Quickdraft units can be installed either in-line with the flue, or on top of the stack.

## Application Engineering

Quickdraft engineers provide expert assistance in determining the most effective solution to any draft inducing application.

# Exhausters

Quickdraft Exhausters are used extensively to vent corrosive, adhesive or explosive fumes and gasses in all type of environments. The units are frequently employed in applications where temperatures may reach 2000 degrees F. To assure optimum performance and minimum cost, Quickdraft application engineers are available to select the equipment best suited to any specific project.

**This cutaway illustration depicts a motor and blower assembly inside a weather-resistant housing. The assembly is connected to a Quickdraft eductor unit. The cutaway view of the eductor shows the nozzle around which air is injected. Note, the solid construction and simplicity of installation.**

## Installation

Quickdraft Exhausters are typically mounted on a roof and discharge to the atmosphere. A wide variety of weather-resistant housings are available to shelter the motor and blower unit.

## Clear-through Flow Path

The Quickdraft Exhauster provides a clear-through flow path for dust/smoke/gasses/fumes which are to be exhausted. There are no moving parts in the exhaust stream. This allows for the safe handling of explosive and/or hazardous elements carried by the air stream. It assures long life for the equipment and it simplifies service since all moving parts are separated from the eductor unit.

## Materials

In many applications, the eductor is constructed of mild steel and may be coated with a variety of corrosion resistant materials. Frequently the units are furnished in varieties of stainless steel such as 304, 309 and 316. Other materials are available to meet application requirements.

## Principle of Operation

Air is injected at high velocity through a plenum chamber controlled by a nozzle into an eductor tube where it entrains the gasses/fumes/vapors which are then exhausted, usually to atmosphere.

# Typical Exhauster Applications

## Perchloric Acid Hood Exhaust

## Paper Mill Exhaust Systems

- Pulper exhaust system
- Black-liquor-mixing tank exhaust system
- Starch kettle exhaust system
- Save all exhaust system

## Food Processing Exhaust Systems

Vent grease laden products of combustion from two microwave bacon hoods.

- Pull grease laden air through a filter which traps the solid particles
- A spray nozzle assembly washes the filter
- Exhaust clean filtered air to atmosphere.

Other typical applications:

- Exhaust caustic air from "tree wash cabinet"
- Steam vapor exhaust from cookers

## Film Extrusion Exhaust System

- Exhaust air with sticky particulate off vacuum box

# Arrangements & Applications for Draft Inducers

Quickdraft system installed vertically on top of a chimney, discharging to atmosphere.

Quickdraft equipment installed in a chimney as part of the flue to preserve architectural design. Motor and blower may be separately located and protected from the weather.

Horizontal installation discharging through a wall, without vertical chimney or stack. H-cap protects discharge opening from wind effect.

Horizontal installation venting to a 90-degree elbow.

Horizontal Quickdraft system venting into a T-connection

Horizontal Installation venting into a masonry chimney.

# Arrangements & Applications for Exhausters

## ARRANGEMENT 1

1A and 1B use "C face" mounted motors, 1/4 HP to 7 1/2 HP. The motor shaft is horizontal in 1A and vertical in 1B. 1C and 1D use foot mounted motors, 10HP and above, motor shafts are horizontal. Plenum openings are either horizontal or vertical as shown.

## ARRANGEMENT 4

Includes blower inlet protection in the form of a screened hood. Used with vertical plenum opening on the eductor unit for 1/4HP to 7 1/2HP motors, and vertical or horizontal plenum openings for motors 10HP and above. A motor base is required for 10HP and above motors.

## ARRANGEMENT 5

Provides a weather housing specifically designed to accommodate all models and sizes.

## ARRANGEMENT 2

This adds a rainsleeve to the blower inlet and a drip cover to the motor. It is intended for use with horizontal plenum openings on the eductor unit and for 1/4 HP to 7 1/2 HP motors.

## ARRANGEMENT 3

Includes a weather-resistant housing for the motor and blower assembly. It may be used for horizontal or vertical plenum openings on the eductor unit. Motors may be from 1/4 HP to 7 1/2 HP.

## ARRANGEMENT 6

This configuration adds noise abatement to weather protection. May be used indoors or outdoors.

## ARRANGEMENT 7

The weather resistant housing here includes filter protection for the inlet air to the blower. It is strongly recommended where ambient air is dust-laden.

CAPACITIES SHOWN ABOVE ARE THE RESULTS OF TESTS CONDUCTED IN OUR FACTORY UNDER TEST CONDITIONS AS ILLUSTRATED BY DRAWINGS.

FLOW CAPACITIES IN CFM ARE CALCULATED FROM AIR FLOW MEASUREMENTS MADE ACROSS THE INTAKE DUCT, AT A POINT ONE AND ONE HALF DIAMETERS UPSTREAM OF THE QUICKDRAFT UNIT, USING A PITOT TUBE AND AN INCLINED MANOMETER. READINGS WERE CORRECTED FOR TEMPERATURE AND PRESSURE AND THEN RECALCULATED TO EQUAL WEIGHTS OF STANDARD CFM AT A DENSITY OF .075 POUNDS PER CUBIC FOOT.

NEGATIVE PRESSURE RATINGS ARE PITOT READINGS OF NEGATIVE STATIC PRESSURE. UNDER THE HEADING "OPEN" ARE LISTED THE NEGATIVE STATIC PRESSURE READINGS MEASURED ONE AND ONE HALF DIAMETERS UPSTREAM OF THE QUICKDRAFT WITH THE 20' LONG INTAKE DUCT UNRESTRICTED. UNDER THE HEADING "CLOSED" THE READINGS ARE MEASURED AT THE SAME POINT WITH THE INTAKE DUCT BLOCKED REDUCING THE FLOW TO ZERO.

"DRAFT" READINGS WERE MEASURED BY INSERTING A STRAIGHT METAL TUBE, CONNECTED TO AN INCLINED MANOMETER, INTO THE CENTER OF THE INTAKE DUCT THROUGH THE SAME OPENING USED FOR THE PITOT TUBE. SUCH READINGS HAVE NO RELATIONSHIP TO VOLUME OR STATIC PRESSURE, OTHER THAN UNDER "CLOSED" OR ZERO FLOW CONDITIONS, AND ARE INTENDED ONLY AS A GUIDE TO PERFORMANCE WHEN MORE COMPLETE TESTING IS INCONVENIENT.

# Sidewall Propeller Fans

Greenheck's sidewall propeller fan line is the ideal choice for factory and warehouse applications where high volumes of air and low pressures are required. From general ventilation to industrial duty, the range of construction and performance capabilities offered in this catalog represent the most comprehensive sidewall propeller fan line in the industry.

Performance spans the range between 300 to 87,000 cfm (510 to 147,814 m<sup>3</sup>/hr) with static pressures to 1.0 in. wg (249 Pa). Fan sizes range from 8 to 54 inches (203 to 1372 mm) for direct drive and 20 to 72 inches (508 to 1829 mm) for belt drive. Regardless of fan size, performance or duty level, all Greenheck sidewall propeller fans are built to perform with the same high standards of reliability and durability.

All models are available in exhaust or supply arrangements. Propellers are available in fabricated steel, fabricated aluminum or cast aluminum. Drive frames and panels are constructed to match the level of duty and the motor size from the smallest low volume model to the largest industrial duty fan.

There is a wide variety of fans to choose from including:

- Three airflow directions; exhaust, supply and reversible
- Both belt drive and direct drive fans
- Three levels of construction from commercial to industrial
- Multiple blade designs for low sound and optimum efficiency

## Belt Drive Blade Designs

### H Type Propeller:

- Straight, moderately pitched blade.
- Designed for applications where static pressures are above 0.5 in. wg (13 Pa).
- These propellers typically run at higher RPMs and generate slightly higher sound levels than the "L" propellers.

### L Type Propeller:

- Swept, steeply pitched blade design.
- Propellers typically run at lower RPMs and generate low sound levels.
- The best selection for sound critical applications or applications that require the best combination of both air and sound performance.
- Typically used when the static pressure is 0.5 in. wg (13 Pa) or less.

The first consideration in any fan selection is the amount of air to be moved and the resistance to this air movement. With specific performance and application criteria in mind, propeller fan selections typically require decisions based on the following criteria.

## Belt Drive vs. Direct Drive

Belt drive fans offer the ability to adjust fan speed for system balancing if necessary. They also offer more flexibility in speeds and motor selections. In a cost comparison, belt drive fans are typically less costly than comparable size direct drive fans with low speed motors.

Direct drive fans are often preferred for jobs where maintenance access is difficult. Maintenance costs are generally lower with direct drive fans, since there are no belts or bearings to replace and no pulleys to adjust.

## Larger Fans vs. Smaller Fans

In most applications, several fans may meet the specified airflow and pressure requirements. Just as larger fans tend to turn slower and generate less sound, they also tend to have higher initial costs but lower operating costs. Smaller fans, with their higher speeds, have more stable performance curves, lower initial costs, higher sound levels, and higher operating costs.

## Low Sound vs. High Static Pressure

Fans selected for high static pressures run at higher speeds and produce higher tip speeds, resulting in higher sound levels. Conversely, in low pressure applications, fans generally run at lower speed producing lower sound levels and are recommended for sound sensitive applications.

## How Accessories Affect Static Pressure

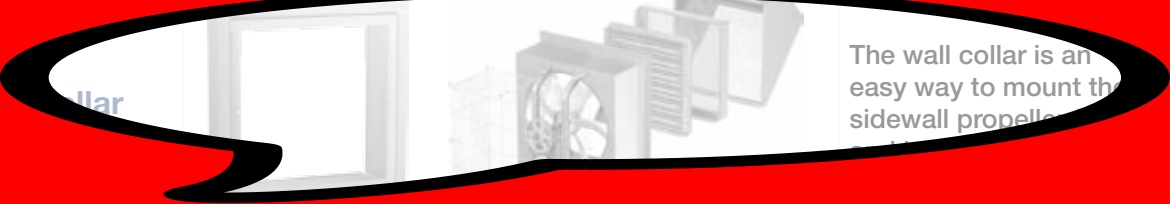

All accessory losses must be accounted for when calculating static pressure load. In most cases dampers, guards and weatherhoods actually add very little to the total system pressure. This means that propeller fans used in conjunction with common accessories can typically be specified with low pressure capabilities below .375 in. wg (93 Pa). However, in cases where airflow velocities exceed 1,500 ft/m (7.6 m/s) through the damper or where filters are used, static pressure loss may be significant. For more specific information on pressure losses due to accessories, refer to pages 8, 9 and 10.

## Motor Service Factor

Motors for sidewall propeller fans are cooled by the airstream. With an uninterrupted flow of cooling air, motors may be operated in their service factor range (up to 20% above the motor's nameplate horsepower) without damage due to overheating. Lesser overloads are recommended for applications using totally enclosed or explosion resistant motors.

Belt drive performance tables in this catalog show two speed selections for each propeller type (L or H) at a given motor hp. The first selection is at 1.0 Bhp service factor. The second speed selection is at 1.2 Bhp service factor. Direct drive performance tables show Bhp levels with service factors ranging up to 1.2 Bhp. When a selection at 1.2 Bhp service factor is not desirable for the application, specify the next higher motor horsepower.

## Standard Wall Mounting

The split drawing (right) illustrates the typical ways of mounting fans directly to the wall when a wall housing or collar is not used.

For exhaust fans, there is a minimum dimension (M) which must be maintained between the propeller and damper, or guard to achieve optimum performance (*failure to meet this minimum dimension will result in loss of fan performance, increased noise and shortened fan and damper life*). There is also a minimum required wall opening dimension (W.O.) to allow the venturi to fit into the wall opening.

The chart at far right provides the minimum "M" and wall opening dimensions.

This installation may require a spacer (by others) between the fan and wall to achieve the minimum "M" dimension.

Fans can be mounted directly to a wall only if the wall is of sufficient thickness to meet the minimum "M" dimension as shown here.

Fan Size	M	Wall Opening

## Standard Horizontal Mounting

Horizontally mounted fans are available for applications requiring vertical airflow.

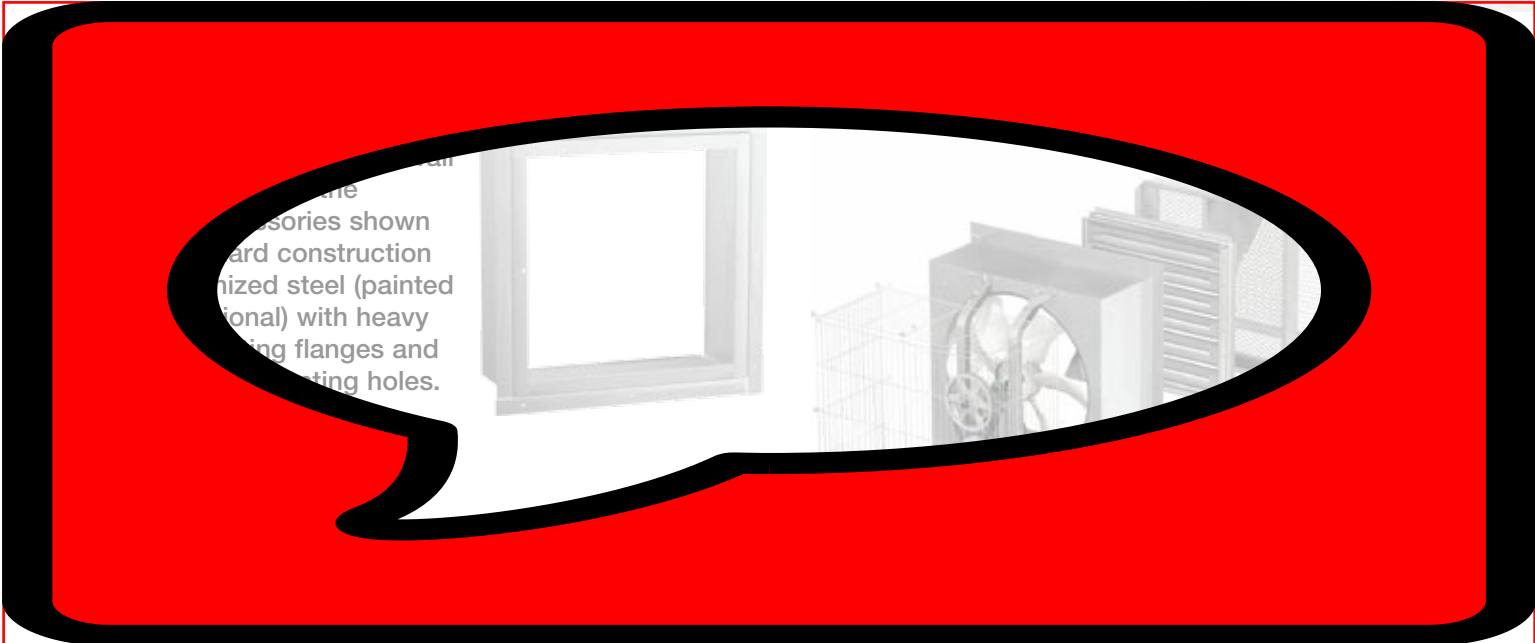

Modifications Shown in Diagrams	
A	Grooved shaft with snap rings (belt drive fans)
B	Motor pulley retaining hardware (belt drive fans with motor on bottom)
C	Reinforcing angles on fan panel (all fans with motor on bottom)
D	Propeller retaining hardware - not shown (direct drive fans with motor on top)

NOTE: Protective guarding is also required below the fan for safety. When guarding is not ordered with the fan, it must be supplied by the installer. When specifying a fan for horizontal mounting, the motor location (top or bottom) and airflow (upward or downward) are required information.

Typical applications include mounting fans in ductwork or plenums as transfer fans or suspending them from the ceiling in a wall housing for use as recirculation fans. Both belt and direct drive fans can be horizontally mounted. Motors can be mounted on top or on bottom with airflow up or down. Specify configuration best suited for access and service.

Horizontally mounted fans are put under different stresses than fans mounted in a wall. Construction modifications are required depending on motor location (top or bottom) and whether the fan is belt or direct drive.

## Wall Housing Mounting

Wall housings are the safest, most efficient and sturdy platform for mounting sidewall propeller fans and their optional accessories. Wall housings allow for a wide range of mounting arrangements to meet specific applications. It is constructed of galvanized steel (painted steel optional) with heavy gauge mounting flanges and prepunched mounting holes. Protective guards of welded steel wire completely protect the drive side of the wall housing. Guards are coated with Permator™, a thermal setting polyester urethane. Other paint finishes are also available. Wall housing guards that meet the OSHA requirements are also available.

The wall housing is designed to reduce installation time and provide maximum installation flexibility. Attached accessories such as backdraft dampers, guards and weatherhoods may mount to either end. As a result a wide variety of configurations are available to accommodate the needs of the system designer.

**NOTE:** Weatherhoods are strongly recommended for all configurations to help prevent moisture infiltration. Mounting flange, damper and guard ship factory mounted on all arrangements as shown except when ordered as a kit.

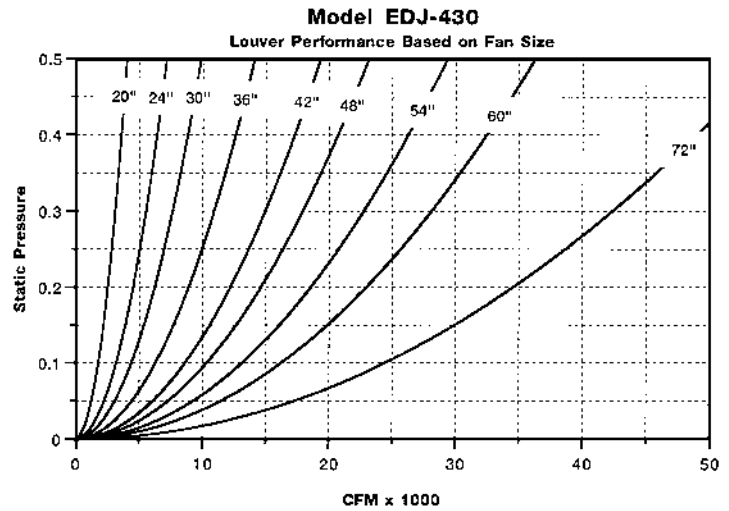

Note: Wall housing, fan, damper and guards ship completely factory assembled except when ordered as a kit. Weatherhood ships loose.

## Louver Mounting

Where an exterior louvered appearance is desired, a variety of louvers can be used in conjunction with the wall housing or wall collar as shown. However, since louver free area is less than half of the wall opening, pressure drop across the louver must be considered when specifying the fan. The graph below shows louver pressure drop for Greenheck model EDJ-430 based on cfm and fan size.

For additional louver information visit [www.greenheck.com](http://www.greenheck.com) or refer to the catalog Louver Products: Severe Duty, Stationary, Operable.

## Mounting Arrangements for Interior Service Applications

The arrangements shown below are the most commonly used and should be considered first for most applications. The choice of flush interior or exterior mounting are based on appearance or space considerations.

Belts, pulleys and motors are serviced from inside the building with these arrangements. See reverse mounting arrangements on page 9 for applications requiring service from outside the building.

Note: To determine the correct arrangement required when ordering—specify arrangement by the drawing number 1A, 2A, 1B or 2B as shown in the diagrams.

### Diffusers Wall Housing Mounted - Manual Operator

Diffusers are constructed with heavy gauge galvanized steel frames, blades and prepunched mounting flanges. They are designed to mount to the interior end of the wall housing when used in the supply configuration. Manual quadrants set the angle of the blades to deflect air in 1, 2 or 4 directions.

They are designed to mount to the interior end of the wall housing when used in the supply configuration. Manual quadrants set the angle of the blades to deflect air in 1, 2 or 4 directions.

### Closure Angles

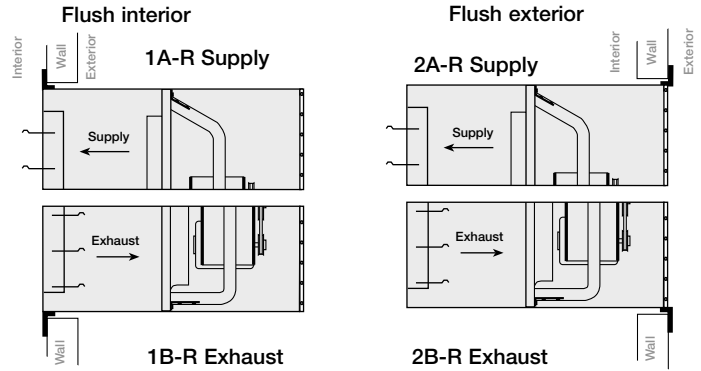

An extra set of mounting flanges are available for field installation to close off the interior wall opening for a finished appearance.

## Arrangements for Exterior Service Applications

### Reverse Mount

Reverse mounting a wall housing simply involves installing the wall housing through the wall opening in the opposite direction of the configurations shown. This results in an opposite effect on fan function. An exhaust fan in a wall housing will function as a supply fan when the housing is reverse mounted.

Example: When the exhaust arrangement shown as 1A is reversed (shown as 1A-R) the same unit now becomes a supply arrangement. The construction, fan position and mounting angle location in both configurations remain identical.

Note: To determine the correct arrangement required when ordering—specify arrangement by the drawing number 1A, 2A, 1B or 2B as shown in the diagrams.

## Filtered Supply Wall Housing Mounting

Filtered supply wall housings are available in seven sizes for fans ranging from size 24 to 54 inches (610 to 1372 mm). They are designed with the draw-thru concept to achieve the highest filter and fan efficiencies.

Standard construction is galvanized steel (painted steel optional). Mounting flanges are factory installed for either flush exterior or flush interior. Permanent 2-inch (51 mm) washable filters are accessed through a bolted panel and can be easily removed for cleaning.

All accessory items available with the standard wall housing can be used with the filtered supply wall housing.

Size	Filter Size & Quantity
24	(4) 23¼ (591) x 16¼ (413)
30	(4) 24¾ (625) x 19¼ (489)
36	(6) 23¼ (591) x 22½ (562)
42	(6) 24½ (613) x 25½ (638)
48	(12) 23¼ (591) x 18¾ (476)
54	(12) 23¼ (591) x 20¾ (527)

Filters are 2 inch (51 mm) nominal thickness. Above filter sizes are actual dimensions. All dimensions given in inches (mm).

### Closure Angles

An extra set of mounting flanges are available for field installation to close off the interior wall opening for a finished appearance.

# Dampers Backdraft

Used alone or in conjunction with the wall housing or wall collar, backdraft dampers are available for exhaust or supply configurations. Backdraft dampers are constructed with galvanized frames, aluminum blades and vinyl blade seals. Actuators are available in 24, 120, 208, 230 or 460 volts. Actuators for 50 cycle voltages are also available.

<sup>1</sup> Model WD-320 and WD-300 are used with fans where the motor is 5 hp or less. For fans with motors larger than 5 hp, the model GM-31 medium duty gravity backdraft damper or the model VCD heavy duty motorized backdraft dampers are required.

<sup>2</sup> Model WD-430 and WD-420 are used with fans where the motor is 5 hp or less. For fans with motors larger than 5 hp, the model VCD heavy duty motorized backdraft dampers are required.

<sup>3</sup> Model WD-220 and WD-210 are used with fans where the motor is 3 hp or less. For fans with motors larger than 3 hp, the model VCD heavy duty motorized backdraft damper is required.

Note: Wall housing length increases by 6 inches (152 mm) when a heavy duty backdraft damper is specified.

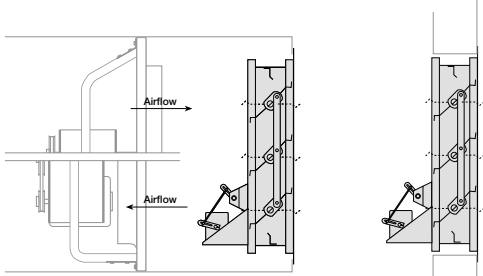

# Dampers

## Volume Control/Heavy Duty

Volume control dampers are available for exhaust or supply configurations and may be used alone or in conjunction with the wall housing or wall collar. Constructed with heavy galvanized steel frames and blades, model VCD dampers are designed to handle higher air volumes than the standard backdraft damper. Dampers are available in standard leakage (VCD-20), low leakage (VCD-23) and insulated low leakage (VCD-34) configurations. Actuators are available in 24, 120, 208, 230 or 460 volts. Actuators for 50 cycle voltages are also available.

(13 mm) polystyrene insulation between two galvanized steel skins.</p>	<p>The VCD damper has the parallel blade set-up and a prepunched mounting flange that provides a flush exterior appearance.</p>	<p>N/A</p>

## Propeller Fan Rotation Guide

Propeller blade should cup and throw the air when rotating in the correct rotation as shown below.

## Electrical Accessories

### Disconnect Switches

Toggle type and heavy duty disconnect switches are available for positive electrical shut-off and safety in servicing fans. The following switches are available to meet individual electrical requirements and can be factory mounted or shipped loose for field mounting. Wiring from the motor to the disconnect box is provided with factory mounted disconnect switches.

- NEMA-1 - General purpose
- NEMA-3R - Rainproof
- NEMA-4 - Watertight
- NEMA-3R & NEMA-4 - Heavy Duty
- NEMA-7 & 9 - for Class 1 and Class 2 hazardous locations.

### One-Point Wiring

Available when the following items are selected: Common voltages on the motor and the actuator, disconnect mounted and wired and a wall housing. The wires are pulled from the motor and the actuator on the damper to the disconnect box. (Hard wiring of the components to the disconnect switch is by others.)

Exception: When a specific voltage is not available on the actuator, Greenheck will provide a hard wired transformer to the actuator. Greenheck will then pull the wires from the transformer to the disconnect box.

### UL/cUL 705

All belt and selected direct drive fans with TE standard efficiency, single-speed motors are available with the UL705 listing for electrical.

### Extended Wiring Pigtail

Available only in conjunction with factory mounted disconnect switches, liquid tight wiring pigtails allow direct hook-up to the power supply which eliminates field wiring at the fan. Internal or external power supply can be specified.

### End Switches

Factory mounted end switches allow the damper to open completely before the fan is energized. This will reduce the back pressure and brake horsepower load on the fan motor at startup. (Field supplied motor starter with a relay is required to complete the wiring on a system using an end switch.)

## Finish Options

### Coatings

A variety of special coatings ranging from enamels to phenolics are available for decorative or protective purposes. When a special coating is selected for the fan, all accompanying accessory items are also coated unless so specified. Consult your local representative for more details.

### Welded and Painted Fan Construction

For applications where extra heavy construction is required, welded steel construction is available. With this option, all stationary connections which are normally bolted are welded and coated with an industrial grade paint. This option applies to belt drive level 3 fans and direct drive level 2 and 3 fans only.

## Direct Drive Number Code

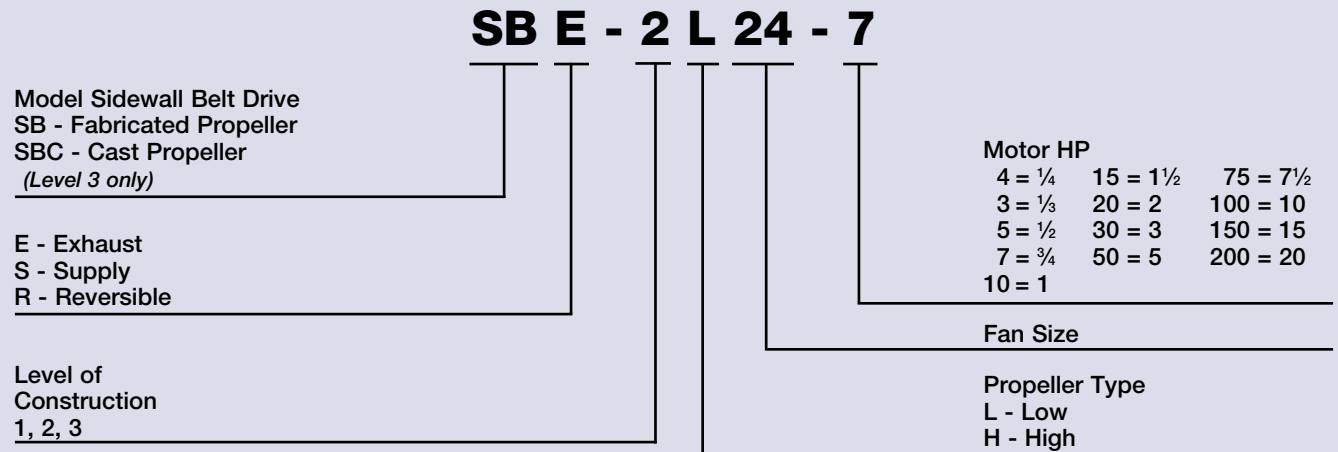

The model number system is designed to completely identify the fan. The correct code letters must be specified to designate direct drive with exhaust or supply air configuration. The remainder of the model number is determined by the size and performance selected from pages 22 through 25.

## Belt Drive Number Code

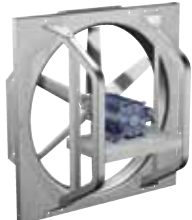

The model number system is designed to completely identify the fan. The correct code letters must be specified to designate belt drive with exhaust or supply air configuration. The remainder of the model number is determined by the size and performance selected from pages 26 through 38.

Performance certified is for Models S1 for installation type A: free inlet, free outlet. Power rating (Bhp) does not include transmission losses. Performance ratings do not include the effects of appurtenances (accessories). \*Speed (RPM) shown is nominal. Performance is based on actual speed of test. The sound ratings shown are loudness values in fan sones at 5 ft (1.5 m) in a hemispherical free field calculated per AMCA Standard 301. Values are for installation type A: free inlet hemispherical sone levels.

Performance certified is for Model SB for installation type A: free inlet, free outlet. Power rating (Bhp) does not include transmission losses. Performance ratings do not include the effects of appurtenances (accessories). \*Speed (RPM) shown is nominal. Performance is based on actual speed of test. The sound ratings shown are loudness values in fan sones at 5 ft (1.5 m) in a hemispherical free field calculated per AMCA Standard 301. Values are for installation type A: free inlet hemispherical sone levels. \*Sones shown apply to the highest cataloged CFM in black type at each fan RPM. For selections at other CFM and static pressure points, refer to CAPS, the Computer Aided Product Selection Program.

Performance certified is for Model SBC for installation type A: free inlet, free outlet. Power rating (Bhp) does not include transmission losses. Performance ratings do not include the effects of appurtenances (accessories). \*Speed (RPM) shown is nominal. Performance is based on actual speed of test. The sound ratings shown are loudness values in fan sones at 5 ft (1.5 m) in a hemispherical free field calculated per AMCA Standard 301. Values are for installation type A: free inlet hemispherical sone levels. \*Sones shown apply to the highest cataloged CFM in black type at each fan RPM. For selections at other CFM and static pressure points, refer to CAPS, the Computer Aided Product Selection Program.

## LUH Horizontal Blower Heater

- 2.6 - 45 kW
- 8,900 - 153,000 Btuh
- 208, 240, 277, 480 and 600 Volt
- 1 or 3 Phase
- Wall or Ceiling Mounted Configurations

### Description

Type LUH self-contained heater provides quiet, reliable fan-forced heating in all types of commercial and industrial applications.

### Applications

- Shipping and Receiving Areas
- Pump Houses
- Power Generating Stations
- Aircraft Hangers
- Factories
- Warehouses
- Garages

### Construction

**Die Formed Cabinet** — Heavy 18 gauge steel, phosphate undercoated for corrosion resistance and finished in almond polyester powder coat.

**Louvers** — Individually adjustable louvers direct air flow up or down as needed.

**Fintube Heating Elements** have corrosion resistant steel fins that are furnace brazed to the tubular element to assure long life and superior heat transfer.

**Fan Motor** — Totally enclosed fan motor is rated for continuous duty with built-in thermal cutout and operates on same voltage as the heating circuit.

**Dynamically Balanced Fan** is attached with rubber vibration insulators for smooth, quiet operation. Blade pitch is carefully selected so that the volume of air moved results in the optimum discharge air temperature.

### Features

- **Sub-divided Circuits with Individual Fuse Protection** — Standard on all heaters with a total current draw of 48 Amps or greater. The fuse compartment is conveniently located for easy access.
- **Integral 120V Control Transformer** — Standard on 480V models, eliminates the need for an external control source (24V optional).
- **Heavy Duty Magnetic Contactors** are standard on all models.
- **Thermal Cutouts** open the control circuit and disconnect power to the heating elements if overheating occurs. **Automatic Reset** allows the control circuit to reclose and restore power when temperature returns to normal.
- **Field Convertible** — Combination 208/240V and 1 or 3 phase operation through 10 kW.
- **Mounting Configurations** — Recessed welded fasteners on top of the heater cabinet are internally threaded for suspension of unit with threaded rods. Ceiling and Universal Wall Swivel brackets are optional. The ceiling bracket lets you mount heater directly to ceiling or over-head member, simply and easily. The swivel mounting allows you to readily adjust the direction of warm air flow for maximum comfort up to 180 degrees.

### Optional Features (Factory Installed or Field Installation Kits)

- **Summer Fan Switch Kit** — Field installable for circulating warm stratified air. Available for all models.
- **Thermostat Kit** — Field installable on all models. Range 40°F - 100°F.
- **Power Disconnect Kit** — Field installable switch enables power to be disconnected while servicing heater. 40, 80 and 100 Amp models available. Mounts in the back of the heater.
- **Ceiling Bracket** (shown above)
- **Wall Mounting Bracket**

### Advantages

- Self Contained
- Versatile, Flexible and High Performance
- Easy Installation
- Minimum Maintenance
- Long Life
- Attractive Appearance

Because it has individually adjustable discharge louvers to direct air flow, and can be wall or ceiling (plus swivel) mounted, the LUH heater may be used in a variety of heating applications:

- Primary Heating
- Supplementary Heating
- Dual System Heating
- Spot Heating
- Entryway Air-Curtain Heating

**Inhalation:** May cause respiratory irritation.

**Skin Contact:** May cause skin irritation.

**Eye Contact:** May cause eye irritation.

**Ingestion:** Likely to be harmful if swallowed.

**Chronic Symptoms:** Contains an ingredient which may cause cancer. Causes damage to organs through prolonged or repeated exposure.

### Indication of Any Immediate Medical Attention and Special Treatment Needed

If symptoms occur, seek medical attention.

## SECTION 5 - FIRE-FIGHTING MEASURES

### Extinguishing Media

**Suitable Extinguishing Media:** Do not attempt to fight fires involving explosive materials or emulsion explosive precursors. Evacuate all personnel to a predetermined safe location, no less than 1/2 mile (800 meters) in all directions.

# Safety Data Sheet

## Special Hazards Arising from the Substance or Mixture

In large, intense fires the emulsion can behave more like an explosive and detonate from confinement or strong shocks. Evacuation of at least 1 mile is recommended if a large amount of emulsion is involved in a large fire.

**Fire Hazard:** May intensify fire; oxidizer. Will burn if exposed to heat, and in addition, will accelerate the burning of other combustibles, resulting in more rapid spread of fire.

**Explosion Hazard:** Heat may build pressure, rupturing closed containers, spreading fire and increasing risk of burns and injuries. May explode when subjected to fire, supersonic shock or high-energy projectile impact, especially when confined or in large quantities.

**Reactivity:** May cause or intensify fire; oxidizer. May accelerate the burning of other combustible materials.

### Advice for Firefighters

**Precautionary Measures Fire:** DO NOT ATTEMPT TO FIGHT FIRES INVOLVING EXPLOSIVE MATERIALS. Evacuate all personnel to a predetermined safe location, no less than 1/2 mile (800 meters) in all directions. Can explode or detonate under fire conditions. Burning material may produce toxic vapors.

**Firefighting Instructions:** DO NOT ATTEMPT TO FIGHT FIRE. Immediately evacuate all personnel from the area to a safe distance. Guard against re-entry. Thermal decomposition can lead to release of irritating gases and vapors.

**Protection During Firefighting:** When controlling fire before involvement of explosives or explosive precursors, firefighters should wear positive pressure self-containing breathing apparatus (SCBA) and full turnout gear.

**Hazardous Combustion Products:** Nitrogen oxides. Carbon oxides (CO, CO<sub>2</sub>). Ammonia.

**Other information:** Do not attempt to fight fires involving explosive materials or emulsion explosive precursors. Evacuate all personnel to a predetermined safe location, no less than 1/2 mile (800 meters) in all directions.

**Reference to Other Sections:** Refer to section 9 for flammability properties.

## SECTION 6 - ACCIDENTAL RELEASE MEASURES

### Personal Precautions, Protective Equipment and Emergency Procedures

**General Measures:** Avoid all contact with skin, eyes, or clothing. Avoid breathing dust, mist, or spray. Keep away from heat/sparks/open flames/hot surfaces. No smoking. Eliminate every possible source of ignition. Evacuate danger area.

#### For Non-Emergency Personnel

**Protective Equipment:** Use appropriate personal protection equipment (PPE).

**Emergency Procedures:** Evacuate unnecessary personnel.

#### For Emergency Personnel

**Protective Equipment:** Use appropriate personal protection equipment (PPE).

**Emergency Procedures:** Ventilate area.

### Environmental Precautions

Prevent entry to sewers and public waters.

### Methods and Material for Containment and Cleaning Up

**For Containment:** Contain any spills with dikes as necessary to prevent migration and entry into sewers or streams. Do not take up in combustible material such as: saw dust or cellulosic material.

**Methods for Cleaning Up:** Collect spillage for possible reuse. Clean up spills immediately and dispose of waste in accordance with appropriate state, federal and local regulations.

### Reference to Other Sections

See heading 8, Exposure Controls and Personal Protection

## SECTION 7 - HANDLING AND STORAGE

### Precautions for Safe Handling

It is recommended that users of explosives material be familiar with the Institute of Makers of Explosives Safety Library publications.

**Additional Hazards When Processed:** When heated to decomposition, emits toxic fumes. Do not puncture or incinerate containers.

## BORAX ANHYDROUS

### Inhalation

Dust may irritate throat and respiratory system and cause coughing.

### Ingestion

Irritating. May cause nausea, stomach pain and vomiting.

### Skin contact

May cause skin irritation/eczema.

### Eye contact

Irritating and may cause redness and pain.

## SECTION 12: ECOLOGICAL INFORMATION

### Ecotoxicity

The product components are not classified as environmentally hazardous. However, this does not exclude the possibility that large or frequent spills can have a harmful or damaging effect on the environment. Boron is the element in sodium tetraborate anhydrous that is used to characterise ecological effects. To convert Sodium tetraborate anhydrous data to Boron, multiply by 0.214.

#### 12.1. Toxicity

##### Acute Fish Toxicity

Boron naturally occurs in seawater at an average concentration of 5 mg B/liter. In laboratory studies the acute toxicity (96-hr LC50) for under-yearling Coho salmon (*Onchorhynchus kisutch*) in seawater was determined as 40 mg B/L (added as Sodium Metaborate). The Minimum Lethal Dose for minnows exposed to Boric Acid at 20°C for 6 hours is 18, 000 to 19, 000 mg/B/l in distilled water, 19, 000 to 19, 500 in hard water.

Rainbow trout (*S. gairdneri*) 24-day LC50 = 150.0 mg/B/L 36-day NOEC-LOEC = 0.75-1 mg/B/L Goldfish (*Carassius auratus*) 7-day NOEC-LOEC = 26.50 mg/B/L 3-day LC50 = 178 mg/B/L.

##### Acute Toxicity - Aquatic Invertebrates

EC50 48 hours 133 mg/l *Daphnia magna*

The units are expressed in 'mg/µg' of: Boron. Test method(s): ASTM Standard E 729-80 Not classified.

##### Acute Toxicity - Aquatic Plants

EC50 72 hours 52.5 mg/l *Selenastrum capricornutum*

The units are expressed in 'mg/µg' of: Boron. Test method(s): OECD 201. Not classified. Summary values used in CSR: >229 mg-boric acid/L.

##### Acute Toxicity - Terrestrial

30 mg/kg *Anas Platyrhynchos* (Mallard duck)

Adverse affect seen in the growth rates of offspring. Test method(s): Test material fed daily to adults/parents.

#### 12.2. Persistence and degradability

##### Degradability

The product is degraded completely by hydrolysis. Boron is an essential micronutrient for healthy growth of plants. It can be harmful for boron sensitive plants in high quantities. The product is soluble in water and is easily absorbed by the soil. Boron is usually found in the soil and is absorbed by the mineral portion of the soil. At high levels it could be toxic to the environment. Limits for the final disposal of waste water: Boron = 2mg/l and disposal at sea: Boron = 10mg/l

#### 12.3. Bioaccumulative potential

##### Bioaccumulative potential

Will not bio-accumulate.

Partition coefficient - 1.09 (22°C)

#### 12.4. Mobility in soil

##### Mobility:

The product is soluble in water.

#### 12.5. Results of PBT and vPvB assessment

### Biological limit values

No biological exposure limits noted for the ingredient(s).

**Appropriate engineering controls** Good general ventilation should be used. Ventilation rates should be matched to conditions. If applicable, use process enclosures, local exhaust ventilation, or other engineering controls to maintain airborne levels below recommended exposure limits. If exposure limits have not been established, maintain airborne levels to an acceptable level. If engineering measures are not sufficient to maintain concentrations of dust/particulates below the Occupational Exposure Limit (OEL), suitable respiratory protection must be worn. If material is ground, cut, or used in any operation which may generate dusts, use appropriate local exhaust ventilation to keep exposures below the recommended exposure limits. Provide eyewash station and safety shower. Ensure adequate ventilation.

**Individual protection measures, such as personal protective equipment**

**Eye/face protection** Wear safety glasses with side shields (or goggles).

**Skin protection**

**Hand protection** Wear appropriate chemical resistant gloves.

**Other** Wear appropriate chemical resistant clothing. Use of an impervious apron is recommended.

**Respiratory protection** Use a NIOSH/MSHA approved respirator if there is a risk of exposure to dust/fume at levels exceeding the exposure limits.

**Thermal hazards** Wear appropriate thermal protective clothing, when necessary.

**General hygiene considerations** Observe any medical surveillance requirements. Keep away from food and drink. Always observe good personal hygiene measures, such as washing after handling the material and before eating, drinking, and/or smoking. ### Description of necessary first aid measures

- Eye contact** : Get medical attention immediately. Call a poison center or physician. Immediately flush eyes with plenty of water, occasionally lifting the upper and lower eyelids. Check for and remove any contact lenses. Continue to rinse for at least 10 minutes. Chemical burns must be treated promptly by a physician.
- Inhalation** : Get medical attention immediately. Call a poison center or physician. Remove victim to fresh air and keep at rest in a position comfortable for breathing. If it is suspected that fumes are still present, the rescuer should wear an appropriate mask or self-contained breathing apparatus. If not breathing, if breathing is irregular or if respiratory arrest occurs, provide artificial respiration or oxygen by trained personnel. It may be dangerous to the person providing aid to give mouth-to-mouth resuscitation. If unconscious, place in recovery position and get medical attention immediately. Maintain an open airway. Loosen tight clothing such as a collar, tie, belt or waistband.
- Skin contact** : Get medical attention immediately. Call a poison center or physician. Flush contaminated skin with plenty of water. Remove contaminated clothing and shoes. Wash contaminated clothing thoroughly with water before removing it, or wear gloves. Continue to rinse for at least 10 minutes. Chemical burns must be treated promptly by a physician. Wash clothing before reuse. Clean shoes thoroughly before reuse.
- Ingestion** : Get medical attention immediately. Call a poison center or physician. Wash out mouth with water. Remove dentures if any. Remove victim to fresh air and keep at rest in a position comfortable for breathing. If material has been swallowed and the exposed person is conscious, give small quantities of water to drink. Stop if the exposed person feels sick as vomiting may be dangerous. Do not induce vomiting unless directed to do so by medical personnel. If vomiting occurs, the head should be kept low so that vomit does not enter the lungs. Chemical burns must be treated promptly by a physician. Never give anything by mouth to an unconscious person. If unconscious, place in recovery position and get medical attention immediately. Maintain an open airway. Loosen tight clothing such as a collar, tie, belt or waistband.

### Precautions for safe handling

**Protective measures** : Put on appropriate personal protective equipment (see Section 8). Avoid exposure - obtain special instructions before use. Do not handle until all safety precautions have been read and understood. Do not get in eyes or on skin or clothing. Do not breathe dust. Do not ingest. Use only with adequate ventilation. Wear appropriate respirator when ventilation is inadequate. Keep in the original container or an approved alternative made from a compatible material, kept tightly closed when not in use. Empty containers retain product residue and can be hazardous. Do not reuse container.

**Advice on general occupational hygiene** : Eating, drinking and smoking should be prohibited in areas where this material is handled, stored and processed. Workers should wash hands and face before eating, drinking and smoking. Remove contaminated clothing and protective equipment before entering eating areas. See also Section 8 for additional information on hygiene measures.

## Section 7. Handling and storage

**Conditions for safe storage, including any incompatibilities** : Store in accordance with local regulations. Store in original container protected from direct sunlight in a dry, cool and well-ventilated area, away from incompatible materials (see Section 10) and food and drink. Store locked up. Keep container tightly closed and sealed until ready for use. Containers that have been opened must be carefully resealed and kept upright to prevent leakage. Do not store in unlabeled containers. Use appropriate containment to avoid environmental contamination.

## Section 8. Exposure controls/personal protection

### Control parameters

#### Occupational exposure limits

Ingredient name	Exposure limits
calcium hydroxide	<b>ACGIH TLV (United States, 3/2016).</b> TWA: 5 mg/m <sup>3</sup> 8 hours.
quartz	<b>ACGIH TLV (United States, 3/2016).</b> TWA: 0.025 mg/m <sup>3</sup> 8 hours. Form: Respirable fraction

**Appropriate engineering controls** : Use only with adequate ventilation. If user operations generate dust, fumes, gas, vapor or mist, use process enclosures, local exhaust ventilation or other engineering controls to keep worker exposure to airborne contaminants below any recommended or statutory limits.

**Environmental exposure controls** : Emissions from ventilation or work process equipment should be checked to ensure they comply with the requirements of environmental protection legislation. In some cases, fume scrubbers, filters or engineering modifications to the process equipment will be necessary to reduce emissions to acceptable levels.

### Individual protection measures

**Hygiene measures** : Wash hands, forearms and face thoroughly after handling chemical products, before eating, smoking and using the lavatory and at the end of the working period. Appropriate techniques should be used to remove potentially contaminated clothing. Wash contaminated clothing before reusing. Ensure that eyewash stations and safety showers are close to the workstation location.

**Eye/face protection** : Safety eyewear complying with an approved standard should be used when a risk assessment indicates this is necessary to avoid exposure to liquid splashes, mists, gases or dusts. If contact is possible, the following protection should be worn, unless the assessment indicates a higher degree of protection: chemical splash goggles and/or face shield. If inhalation hazards exist, a full-face respirator may be required instead.

**Hand protection** : Chemical-resistant, impervious gloves complying with an approved standard should be worn at all times when handling chemical products if a risk assessment indicates this is necessary. Considering the parameters specified by the glove manufacturer, check during use that the gloves are still retaining their protective properties. It should be noted that the time to breakthrough for any glove material may be different for different glove manufacturers. In the case of mixtures, consisting of several substances, the protection time of the gloves cannot be accurately estimated.

**Body protection** : Personal protective equipment for the body should be selected based on the task being performed and the risks involved and should be approved by a specialist before handling this product.

**Other skin protection** : Appropriate footwear and any additional skin protection measures should be selected based on the task being performed and the risks involved and should be approved by a specialist before handling this product.

## Section 8. Exposure controls/personal protection

- Respiratory protection** : Based on the hazard and potential for exposure, select a respirator that meets the appropriate standard or certification. Respirators must be used according to a respiratory protection program to ensure proper fitting, training, and other important aspects of use.

## Section 4. First-aid measures

### Description of necessary first aid measures

- Eye contact** : Immediately flush eyes with plenty of water, occasionally lifting the upper and lower eyelids. Check for and remove any contact lenses. Continue to rinse for at least 10 minutes. Get medical attention.
- Inhalation** : Remove victim to fresh air and keep at rest in a position comfortable for breathing. If not breathing, if breathing is irregular or if respiratory arrest occurs, provide artificial respiration or oxygen by trained personnel. It may be dangerous to the person providing aid to give mouth-to-mouth resuscitation. Get medical attention if adverse health effects persist or are severe. If unconscious, place in recovery position and get medical attention immediately. Maintain an open airway. Loosen tight clothing such as a collar, tie, belt or waistband.
- Skin contact** : Flush contaminated skin with plenty of water. Remove contaminated clothing and shoes. Get medical attention if symptoms occur. Wash clothing before reuse. Clean shoes thoroughly before reuse.
- Ingestion** : Wash out mouth with water. Remove dentures if any. Remove victim to fresh air and keep at rest in a position comfortable for breathing. If material has been swallowed and the exposed person is conscious, give small quantities of water to drink. Stop if the exposed person feels sick as vomiting may be dangerous. Do not induce vomiting unless directed to do so by medical personnel. If vomiting occurs, the head should be kept low so that vomit does not enter the lungs. Get medical attention if adverse health effects persist or are severe. Never give anything by mouth to an unconscious person. If unconscious, place in recovery position and get medical attention immediately. Maintain an open airway. Loosen tight clothing such as a collar, tie, belt or waistband.

**Unsuitable extinguishing media** : None known.

- Specific hazards arising from the chemical** : No specific fire or explosion hazard.

- Hazardous thermal decomposition products** : Decomposition products may include the following materials:  
carbon dioxide  
carbon monoxide

- Special protective actions for fire-fighters** : Promptly isolate the scene by removing all persons from the vicinity of the incident if there is a fire. No action shall be taken involving any personal risk or without suitable training.

- Special protective equipment for fire-fighters** : Fire-fighters should wear appropriate protective equipment and self-contained breathing apparatus (SCBA) with a full face-piece operated in positive pressure mode.

## Section 6. Accidental release measures

### Personal precautions, protective equipment and emergency procedures

- For non-emergency personnel** : No action shall be taken involving any personal risk or without suitable training. Evacuate surrounding areas. Keep unnecessary and unprotected personnel from entering. Do not touch or walk through spilled material. Avoid breathing dust. Provide adequate ventilation. Wear appropriate respirator when ventilation is inadequate. Put on appropriate personal protective equipment.  
**For emergency responders** : If specialized clothing is required to deal with the spillage, take note of any information in Section 8 on suitable and unsuitable materials. See also the information in "For non-emergency personnel".

- Environmental precautions** : Avoid dispersal of spilled material and runoff and contact with soil, waterways, drains and sewers. Inform the relevant authorities if the product has caused environmental pollution (sewers, waterways, soil or air).

### Methods and materials for containment and cleaning up

## Section 6. Accidental release measures

- Small spill** : Move containers from spill area. Absorb spillage to prevent material damage. Avoid dust generation. Using a vacuum with HEPA filter will reduce dust dispersal. Place spilled material in a designated, labeled waste container. Dispose of via a licensed waste disposal contractor.
- Large spill** : Move containers from spill area. Absorb spillage to prevent material damage. Approach release from upwind. Prevent entry into sewers, water courses, basements or confined areas. Avoid dust generation. Do not dry sweep. Vacuum dust with equipment fitted with a HEPA filter and place in a closed, labeled waste container. Avoid creating dusty conditions and prevent wind dispersal. Dispose of via a licensed waste disposal contractor. Note: see Section 1 for emergency contact information and Section 13 for waste disposal.

## Section 7. Handling and storage

### Precautions for safe handling

- Protective measures** : Put on appropriate personal protective equipment (see Section 8). Do not ingest. Avoid contact with eyes, skin and clothing. Avoid breathing dust. Keep in the original container or an approved alternative made from a compatible material, kept tightly closed when not in use. Empty containers retain product residue and can be hazardous. Do not reuse container. Absorb spillage to prevent material damage.
- Advice on general occupational hygiene** : Eating, drinking and smoking should be prohibited in areas where this material is handled, stored and processed. Workers should wash hands and face before eating, drinking and smoking. Remove contaminated clothing and protective equipment before entering eating areas. See also Section 8 for additional information on hygiene measures.
- Conditions for safe storage, including any incompatibilities** : Store in accordance with local regulations. Store in original container protected from direct sunlight in a dry, cool and well-ventilated area, away from incompatible materials (see Section 10) and food and drink. Store in a corrosion resistant container with a resistant inner liner. Keep container tightly closed and sealed until ready for use. Containers that have been opened must be carefully resealed and kept upright to prevent leakage. Do not store in unlabeled containers. Use appropriate containment to avoid environmental contamination.

## Section 8. Exposure controls/personal protection

### Control parameters

#### Occupational exposure limits

Ingredient name	Exposure limits
sodium carbonate	-

- Appropriate engineering controls** : Use only with adequate ventilation. If user operations generate dust, fumes, gas, vapor or mist, use process enclosures, local exhaust ventilation or other engineering controls to keep worker exposure to airborne contaminants below any recommended or statutory limits.
- Environmental exposure controls** : Emissions from ventilation or work process equipment should be checked to ensure they comply with the requirements of environmental protection legislation. In some cases, fume scrubbers, filters or engineering modifications to the process equipment will be necessary to reduce emissions to acceptable levels.

### Individual protection measures

## Section 8. Exposure controls/personal protection

- Hygiene measures** : Wash hands, forearms and face thoroughly after handling chemical products, before eating, smoking and using the lavatory and at the end of the working period. Appropriate techniques should be used to remove potentially contaminated clothing. Wash contaminated clothing before reusing. Ensure that eyewash stations and safety showers are close to the workstation location.
- Eye/face protection** : Safety eyewear complying with an approved standard should be used when a risk assessment indicates this is necessary to avoid exposure to liquid splashes, mists, gases or dusts. If contact is possible, the following protection should be worn, unless the assessment indicates a higher degree of protection: chemical splash goggles. If operating conditions cause high dust concentrations to be produced, use dust goggles.
- Hand protection** : Chemical-resistant, impervious gloves complying with an approved standard should be worn at all times when handling chemical products if a risk assessment indicates this is necessary. Considering the parameters specified by the glove manufacturer, check during use that the gloves are still retaining their protective properties. It should be noted that the time to breakthrough for any glove material may be different for different glove manufacturers. In the case of mixtures, consisting of several substances, the protection time of the gloves cannot be accurately estimated.
- Body protection** : Personal protective equipment for the body should be selected based on the task being performed and the risks involved and should be approved by a specialist before handling this product.
- Other skin protection** : Appropriate footwear and any additional skin protection measures should be selected based on the task being performed and the risks involved and should be approved by a specialist before handling this product.
- Respiratory protection** : Based on the hazard and potential for exposure, select a respirator that meets the appropriate standard or certification. Respirators must be used according to a respiratory protection program to ensure proper fitting, training, and other important aspects of use.

## GENERAL SAFETY REQUIREMENTS

---

This manual contains specific precautionary statements relative to worker safety in appropriate sections. To avoid dangerous situations we give you the following advice:

*Refers to special information on how to use the dust collector most efficiently.*

*Refers to special information directed towards preventing damage.*

*Refers to special information designed to prevent injury or extensive damage.*

*The collector should be stored as supplied. Remove packaging for installation only.*

*For the purposes of storage:*

- *Collector with specification for inside use = IP50*
- *Collector with specification for outside use = IP54*

*The dust collector has been built in accordance with state-of-the-art standards and recognised safety rules. Nevertheless if not handled carefully it may put people at risk and also cause damage.*

*The dust collector should be used only when it is in technically perfect condition, in accordance with its designated use and the instructions set out in the operation manual. Any functional disorders, especially those affecting safety, should therefore be rectified immediately.*

*Ensure proper training is given to operators before start-up. The dust collector is designed exclusively for use within the scope of delivery, and in accordance with drawing(s) and the specification sheet.*

*Do not put lit cigarettes or any burning object into the hood or ducting of any dust collection system.*

*Regular maintenance is important for a good performance of your dust collector. A prudent user of Donaldson Torit equipment should consult and comply with all relevant Fire Codes and/or other appropriate codes when determining the location and operation of dust collection equipment.*

*A hand-operated supply disconnecting device is necessary for each incoming electrical supply in accordance with EN 60204-1.*

*To prevent accidents the access to the fan impellor must not be possible during operation. Refer to EN 294.*

*Disconnect all power before servicing. All electrical work must be done by a qualified electrician according to local codes.*

*All exposed conductive parts of the electrical equipment and the dust collector shall be connected to the protective bonding circuit (refer to EN 60204-1).*

*Shutoff and bleed-off compressed air supply before doing any service work.*

*In each individual case vent design, vent ducts and pressure resistant design are worked out by Donaldson Torit for the specific products, circumstances and environment, and should never be altered unless Donaldson Torit has given explicit admission.*

*All electrical equipment should be dust explosion proof according to the zoning and surface temperature limitations of the equipment.*

*The dust collector cannot be used in a potentially explosive atmosphere (according to ATEX directive 2014/34/EU), unless stated otherwise on the nameplate of the unit and the scope of delivery.*

*When handling explosive or flammable materials, the collector should be located so as to avoid external heat source- e.g. from nearby processes or extreme direct sunlight.*

*The user of the dust collector is responsible for disposal of any dust generated by the process, in accordance with local regulations.*

*The dust collector will not prevent explosions;*

*The main cause of dust explosions in dust collectors are hot and glowing particles which are formed in the process upstream - these are conveyed into the collector and get imbedded on the filter medium. There they either extinguish or develop into a smoldering or even open fire, in the end leading to an explosion.*

A prudent user of Donaldson Torit dust collectors should:

- Take every possible precaution to prevent a fire or explosion from occurring.
- Consult with their insurance carrier or local authorities regarding the hazardous nature of dust produced.
- If dust is classified poisonous, corrosive or irritant as per 'Gef-Stoff V', an explosion venting system should not be used. The dust collector will then have to be protected from explosion by other methods (consult your Donaldson Torit representative).
- Sizing of the bursting opening + reinforcement of the dust collector are dependent on the dust collector type, the dust explosiveness (Kst value or St classification) and on the blow-off channel length + size when required.
- Consult and comply with national and local codes or bulletins (VDI 3674) when determining location and operation of Donaldson Torit dust collectors.
- Use only authorised replacement parts supplied by Donaldson Torit.
- Unless otherwise specified, DO NOT exceed negative operating pressure as specified by technical data, DO NOT use on positive pressure systems.
- Insure that the operating temperature of the dust collector does not exceed 120° C.
- Do not locate the bursting panel assembly where people are exposed to the bursting panel itself or to the area above or in front of the bursting panel as they may be injured by the escaping pressure, fire, noise, chemicals and/or fragmenting particles. The location of the bursting panel must be such that the discharge cannot be the ignition source of secondary explosions. Interfacing equipment and/or machinery must also be protected.
- Refer to guidelines VDI 3673.

*Gas explosion proof equipment is not necessary but may be used when appropriate.*

## **Maintenance and explosion safety**

### **a. Introduction**

The collection systems are designed and installed by Donaldson Torit engineers applying the most appropriate safety measures based upon state of the art knowledge and technology.

It's safety is based upon two main objectives:

- Prevent ignition sources that might be caused by the collection system itself, as far as it is practically possible, by using appropriate dust explosion proof electrical equipment, antistatic filter cartridges, conductive construction materials and ducts which are all bonded and grounded.
- Confine an actual explosion caused by an ignition source coming from the process or induced by the user (hot work collection system) in such a way that no hazardous effects occur:
  - to plant personnel
  - to the location in which the dust collector is installed
  - to equipment connected to the dust collector

*If the dust collector's original design or the actual process is changed without implementing the changes in the safety design of the collection system, it's safety can be jeopardised. However, poor and/or incorrect maintenance can also jeopardise the safety of the system.*

### **b. Hazards due to change of dust collector design**

*The housing is modified; a larger volume, weaker housing (e.g. by installing extra inlets or manholes).*

*The vent area is reduced; e.g. by obstructing the vent by ducts or other obstacles.*

*The vent panel type is changed; e.g. by using a panel that has a higher opening pressure or larger inertia.*

*The vent duct is modified; longer, smaller cross section, bends, obstacles or extra covering on the outlet.*

*The vent location is altered; e.g. instead of top venting now side venting is applied- besides possibly obstructing the vent process, reaction forces may cause the collector to tumble over.*

*If applicable, the explosion suppression system is modified.*

*In these cases the safety measures may not be able to protect sufficiently and the explosion may destroy the housing and or the vent duct causing hazards around the dust collector. In particular when the dust collector is located inside the hazards are eminent.*

*The rotary valve is taken out or exchanged by a non explosion proof type. Or the explosion resistant receiver bin is exchanged by a non appropriate type. This may lead to flames, or worse, a fireball emerging from the hopper.*

*The use of plastic bags in the receiver bin under the hopper is not recommended because sometimes, due to very high electrostatic charges, hazardous discharges may occur.*

#### **c. Hazards due to relocation of the dust collector**

*By relocating the dust collector from outside to inside you should be aware that the explosion now is vented inside a room, which is not acceptable, due to the very hazardous flame jets and fire balls.*

*Also, relocating outside may be hazardous when the explosion vent points into a direction where people may get hurt or property may be damaged.*

#### **d. Hazards due to change in process or product**

*By changing the process, the amount of product, process temperatures and, most importantly, product ranges may alter. If the products explode more violently than initially foreseen the explosion may damage or destroy the dust collector.*

#### **e. Hazards due to poor or lack of maintenance**

*The wrong filter cartridges are installed; non antistatic type may lead to ignition in the dust collector.*

*The filter cartridge porthole or another part of the housing (access cover) is not fixed correctly and may tear up during an explosion causing a flame jet or fireball.*

*Retrofitting metal ducts by non-conductive plastic hoses, plastic or flexible ducts may lead to hazardous electrostatic discharges.*

*Failing of bonding and grounding of metal parts and ducts (resistance between metal parts preferably should be less than 100 Ohms).*

*Painting of the inside with high resistant coating that may result in hazardous electrostatic discharges.*

*Welding, cutting etc. (all hot work activities) on an operating or not thoroughly cleaned not operating dust collector will result in strong ignition sources and explosions.*

*Painting of explosion vents may result in higher opening pressures: collapse of the housing.*

*If abrasive products are used, in time this may result in thinner walls of ducting and dust collector housing, thus reducing the strength of the equipment and it's explosion resistant properties.*

#### **f. Hazards due to wrong actions**

*Opening of the dust collector during operation: loss of containment.*

*Vent surrounding: if used as a storage area or frequented by personnel: a vented explosion will cause damage to stored goods and hurt or kill personnel.*

## g. Do's and don'ts

*Based upon several hazards a list of do's and don'ts is given.*

*Perform a regular maintenance by disposing the dust in a regular fashion and inspecting the cleaning mechanism on a regular basis at least once a month.*

*Return the installation in its original state after maintenance (fixing, closing and bonding and grounding).*

*Check the grounding and bonding at least once a year.*

*The housing of the dust collector should never be changed or painted on the inside with a non-conducting coating.*

*Vents should never be blocked or painted.*

*Use the original bursting panel types only.*

*Do not alter the vent area or vent location.*

*Vent ducts should never be altered.*

*Do not tamper with explosion protection systems such as explosion suppression and explosion barriers as quick acting valve.*

*Use original equipment as filter cartridges, electrical equipment, rotary valves etc..*

*Do not use non-conductive plastic hoses and pipes.*

*Prevent goods and forbid personnel to be near such a vent.*

*Never open the dust collector during operation.*

*After emptying the receiver bin, fix it as in the original state.*

*Keep the working place clean.*

*For any changes in the dust collector, safety system, process, product or dust collector location consult the manufacturer.*

## h. Applications having a risk of sparks and fires

### 1. Good Housekeeping

Accumulation of potentially combustible dust, for example dust layers is considered a potential ignition source. Failure to keep the dust collector clean and empty the hopper / dust bins regularly will increase the risk of fires and/or explosions.

### 2. EU Directive 99/92/EC.

A reinforced and/or vented dust collector must be used when handling dusts that have the potential to form an explosive atmosphere. If a non-reinforced and/or non vented dust collector is used on these applications then the end user must ensure an equivalent, secure, and fool proof basis of safety, which must be clearly documented in the end users Explosion Protection Document in line with Article 8 of EU Directive 99/92/EC.

### 3. Self Heating Materials

Please note that some materials have the potential to self generate heat and hence to become an ignition source, that could result in a fire and / or an explosion. For this reason ferrous and non-ferrous materials should not be extracted in to the same dust collector, as when combined they can create a violent thermite reaction that would ignite a fire and/or explosion.

#### 4. Applications having a risk of sparks and fires

Where sparks are generated by the process, this must be considered as a potential ignition source which increases the risk of a fire or explosion. The filter can be supplied with an optional spark trap to help reduce the frequency of spark ignition and should be regarded as part of a risk reducing strategy. The spark trap is not an extinguishment system and should never be relied upon to achieve spark eradication in processes where suppression requirements are absolute. The spark trap does not guarantee complete elimination of sparks and does not preclude the possibility of fire or explosion. Therefore, system redundancy and complementary measures should be taken in conjunction with the spark trap to further reduce the risk of fire and explosion from sparks in applications where there is potential for catastrophic combustion.

On these types of applications the enduser should carry out regular good housekeeping, such as:

- a. Periodically check for dust fall out in ducting and remove.
- b. Pulse down off line regularly to minimise retention of dust cake on filter cartridges.
- c. Empty dust bins frequently.

Other risk reducing strategies could include

- a. Inject with an inert material.
- b. Consider additional spark detection and fire suppression equipment.

## INTRODUCTION

---

### Product information

---

The dust collector is used for the collection of airborne dust and particulate. Whether in response to the problem of air pollution, or as part of a manufacturing process, the dust collector provides highly efficient, continuous, on-line dust collection.

The filter cartridges are the heart of the dust collector. These filter cartridges help ensure that only cleaned air is returned to the plant environment.

The reinforced dust collector can collect explosive dust without putting people at risk and with a minimum of structural damage as a result of an explosion, assuming that all safety guidelines in this manual are followed. For each reinforced model the maximum Kst value for an inside as well as an outside installation is defined (see spec sheet).

Be sure that the explosive (Kst value) of your dust is always below the maximum Kst value defined for your dust collector type.

Technical and field support are available from your local Donaldson Torit representative or distributors to answer your questions.

### Function

---

During operation, contaminated air enters the dust collector through the dirty air inlet area and passes through the filter cartridges.

Dust is collected on the outside surface of the filter cartridges.

The filtered air flows through the centre of the filter cartridges into the clean air chamber, where it exits through the clean air outlet and can be recirculated into the environment.

To ensure the optimal performance of your dust collector it is necessary that the filter cartridges are cleaned automatically and sequentially.

During the cleaning sequence, the timer energizes a solenoid valve, causing the corresponding diaphragm valve to send a pulse of compressed air through the filter cartridges (from the inside outward), removing the collected dust from the outside surfaces of the filter cartridges.

The dust falls through the hopper into the dust disposal system.

### **Protection of the dust collector against dust explosion**

The reinforced dust collectors are protected against dust explosions both by preventive and by constructional measures.

Preventive measures are to prevent ignition sources in the delivered installations:

- Electrical equipment is dust explosion proof: IP6X for zone 20 and IP5X for zone 21 plus equipment surface temperature limitation (depends upon the product). Gas explosion proof equipment is not necessary but may also be applied when appropriate.
- If necessary, the filter cartridges are antistatic. (see scope of delivery).
- All conducting parts are grounded or bonded and connected to ground.
- Internal coatings do not cause static hazards etc.

However, these measures do not prevent ignition sources due to the process or outside influences. Means to eliminate ignition sources from entering the dust collector are a preseparator, a spark trap or a spark detection with extinguishing system. Supply of these items are optional and will depend upon the typical process parameters (see scope of delivery).

So-called constructional or post-operative measures are measures to limit the potential explosion effects in case an explosion still takes place in spite of the preventive measures.

The measures taken on the reinforced dust collector are:

- Explosion venting in combination with explosion resistant design for the expected reduced overpressure and compartmentation

This is a typical mean against the effects of explosions. Of course against fire hazards alone the dust collector can be delivered with optional sprinkler systems or other extinguishing systems.

By venting the explosion to the outside in a safe direction (outside), the pressure inside the dust collector is limited such that it will not collapse. The vent area is designed using:

- VDI 3673. Pressure Venting of Dust Explosions, VDI-Kommision Reinhaltung der Luft, July 1995.
- NFPA 68. Guide for Venting of Deflagrations, 1994 Edition.
- EN 14491. Dust explosion venting protective systems, March 2006.
- IChemE. Dust explosion prevention and protection, 2002.

The explosion panels are certified and provided with a device to detect its actual opening up. This device should be used to stop the plant automatically by interlocking and can be used to activate a sprinkler system to extinguish a fire following the explosion.

By using vent ducts in case of indoor installation, the explosion is lead to the outside and into a safe direction. Vent ducts, however, will increase the expected reduced explosion pressure considerably. To prevent that the expected reduced explosion pressure exceeds the design strength of your Donaldson Torit dust collector, the maximum Kst value of your dust to be collected has to be considerably lower in case of using vent ducts .

There also should be taken into account that, due to the venting explosion, the dust collector is subjected to a reaction force.

Standard Donaldson Torit dust collectors are vented vertically and the reaction forces will be directed downwards into the foundation of the dust collector: this causes no hazards.

However, when the dust collector is side vented, the reaction forces also are directed horizontally and may push the dust collector over if not secured well. Therefore in case of horizontal vents the Donaldson Torit dust collectors should be specially secured. See figure 5: Typical foundation anchor, page 17.

*In case of side venting, the dust collector will have to be adequately supported in order to cope with horizontal recoil forces. See figure 5: Typical foundation anchor, page 17.*

To prevent that the explosion runs back to connected equipment, a back-flap valve or other explosion barriers should be installed.

To prevent propagation of fire, burning products or explosion from the hopper to the outside or process, through the hopper outlet, either an explosion proof rotary valve should be installed that automatically stops at explosion detection or an explosion proof reception bin or other explosion proof dust discharge systems.

## PRIOR TO INSTALLATION

---

### Location

---

The dust collector should be located with consideration for:

- emptying the dust disposal (see figure 1, page 8)
- shortest runs of inlet and outlet ductwork
- radius bends on elbows as big as possible
- easy access to electrical and compressed air connections
- convenience of maintenance

*Consult the technical specification sheet and drawings for the dust collector weight and dimensions.*

For calculating for foundation or supporting structure consider the following factors:

- the weight of the dust collector
- the material being collected
- all auxiliary equipment
- live loads
- for outdoor installation: snow and wind loads

### Required tools and equipment

---

- crane/fork lift
- slings/clevis pins and adequate lifting equipment
- standard tools (screwdrivers, wrenches, etc.)
- drill
- pipe sealant

### Delivery and inspection

---

*The dust collector is normally shipped by truck and should be checked for any damage that may have occurred during shipping.*

Note that the bursting panel is always shipped mounted upside-down on the dust collector top flange to prevent any damage.

On top of the bursting panel a galvanised plate is positioned to protect the panel from damage during transportation. The bursting panel and galvanised plate are secured in place with 4 bolts. The other bolts, nuts and washers and the burst indicator switch are delivered together with the dust collector.

Compare the parts received against the packing list. If there is damage or parts missing, notify the delivery company and your local Donaldson Torit representative.

## INSTALLATION

---

*All external equipment connected to the inlet, outlet or discharge (e.g. ducting, rotary valve) should be correctly sealed. This can be achieved by applying a continuous 5 mm bead of sealing compound to the mounting surface, along each side of the hole pattern. For non-Donaldson Torit equipment please also check supplier's IOM manual for any specific requirements.*

### Unloading and transport to location

---

*Before unloading, remove all packing and strapping.*

A crane is recommended for the unloading, transport and installation of the dust collector.

*Connect lifting sling to the lifting lugs with clevis pins and distribute loads equally. Use spreader bar if necessary.*

In case of inside installation, a vented dust collector will be provided with a special roof flange. This allows the mounting of a blow off channel (max 3m) around the bursting panel. Channel will divert escaping pressure outside the premises.

Ensure blow off channel is mounted on roof flange with the pre-drilled hole on the same side as the sensor brackets of the bursting panel. This hole is used to pass the cable of the sensor through the blow off channel.

STEPS 1-2

1. Place hopper discharge-side up on ground or other level surface and attach legs to hopper.
2. Assemble leg cross braces.
3. Turn hopper and leg assembly over and lift into position over anchor bolts.
4. Level hopper.
5. Tighten all fasteners securely, including all anchor bolts.

Tighten all hardware before removing crane.

6. Apply sealant to hopper flange
7. Lift unit over leg and hopper assembly and lower slowly.
8. Secure with bolts, washers, and nuts supplied.
9. Apply sealant around inlet opening.
10. Lift inlet onto collector. Secure with bolts, washers, and nuts supplied.

## Installation and assembly

Anchor the dust collector to the foundations.

If any of the following equipment is ordered and mounted please follow the respective instructions.

## Hopper & leg installation

(see figure 'Hopper & Leg Installation')

There are three types of hoppers for your dust collector:

1. a single module wide which spans two portholes
2. a single module wide which spans three portholes
3. a double module wide which spans four portholes

Each of these styles transition to a single outlet opening. All of the leg arrangements are shown in figure 6, 'Leg positioning'. The position of the legs, cross bracing and hoppers for each dust collector size is shown.

1. Stand the hopper(s) up with the disposal end up (hopper outlet).
2. Use drift pins to align the holes in the hopper gussets and legs, and attach the legs with the bolts, washers and nuts. **Do not tighten hardware at this time!**
3. Use drift pins to align the holes in the cross bracing on the rear side of the leg set.
4. Recheck the position of the legs and cross bracing against figures 'Leg Bolting Details' and 'Standard Leg Packs' and the drawing.
5. Join hoppers together at the hopper gussets using bolts, washers and nuts. **Do not tighten hardware at this time!**
6. Flip over the now-assembled hopper/leg pack assembly so that it is standing on its legs (hopper outlet pointing down). This step may require a crane. Another option is to divide the hopper/leg pack assembly into smaller sections to flip over. Make sure to join hopper together after flipping over.
7. Lift the assembled collector onto the foundation. Fasten each footplate of the leg anchor bolts with flat washers, lock washers and nuts. **Do not tighten hardware at this time!** (Depending on the type of anchor bolts, anchor bolts can be mounted afterwards).

**Provisional anchor bolt recommendations**

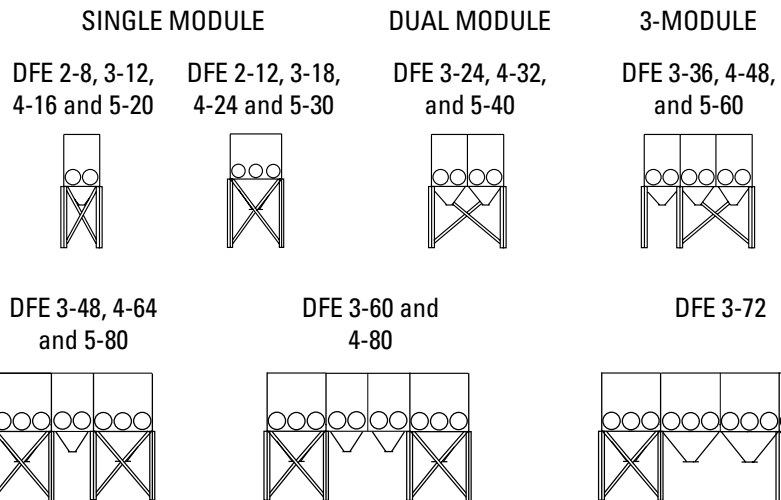

9. Consider Hilti HIT-HY 200 Anchor System or equivalent. Quantity of anchor bolts should match the number of holes provided in the base plates
10. Anchor diameter is typically 3 mm less than baseplate hole diameter.
11. Corrosive environment or outdoor installation may require stainless steel anchors.

Anchor should project a minimum of 45 mm and account for nut, washer, base plate and shims/grout.

Embedment depth

**Figure 7: Leg positioning**

## Field joining installation

---

(See figure 'Field Joining Installation')

The dust collector is a modular unit that may require field joining. The field joint may be a result of truck capacity, crane capacity or specific customer requirement.

A detailed drawing of how to join your dust collector has been shipped with your dust collector. Most of the joining hardware is on the inside of the collector. A stepladder will be helpful in assembling the flanges near the top of the collector. Both the dirty air and the clean air chambers will have to be accessed during joining.

*Two cranes are required.*

*Read all instructions for assembly.*

*Leave one hopper off the collector on either side to the joint.*

*The yokes, filter, cartridge baffles and outlet covers have been left off the joint side.*

*Follow all safety precautions when installing your dust collector.*

1. Remove the protective shipping cover from each module.
2. Remove one inspection cover on the clean chamber.
3. Apply sealant to one side of the joint. Follow the sealant pattern exactly as it is shown in Figure 'Field Joining Installation'.
4. Lift both units with cranes into position for joining. Align the bolt holes in the flanges with drift pins. Bolt the joint together with the bolts, washers and nuts. Do not tighten hardware.
5. When all of the hardware has been attached to the collector, make sure that the joints are flush and tighten all hardware.
6. During the tightening sequence, some sealant may loosen out of the joint.

*Wearing protective rubber gloves, proceed to move any excess. Dispose of excess sealant properly.*

7. Proceed with the assembly of the collector.
8. Reinstall the inspection cover.

*Two cranes are required to lift and assemble modules.*

1. Remove the protective cover from the end of each module.
2. Remove one column of access covers, filters, venturis, and yokes from the joint side of each module as shown in Detail A.
3. Remove outlet cover from the bottom of the clean-air plenum and set aside.
4. Apply a generous amount of sealant to one module to create an airtight seal between the clean- and dirty-air plenums as shown in Detail B.
5. Lift both modules into position using two cranes.
6. Use drift pins to align the bolt holes in the mating flanges.

**Figure 8: Field joining Detail A**

7. Bolt the modules together using bolts, washers and nuts as shown in Details B and C. Do not tighten hardware at this time.

**Figure 9: Field joining Detail B**

**Figure 10: Field joining Detail C**

8. Check that all joints and flanges are flush and tighten hardware starting with the joint between the clean- and dirty-air plenums. Remove excess sealant.

### Yoke, venturi and filter installation

*Installing yokes requires two people.*

1. From the clean air plenum (to access, remove the outlet cover, see Detail D in Figure 10 -Yoke, venturi and filter installation), thread a hex jam nut and flat washer to the shoulder of each of the three yoke rod ends. See Detail C.
2. Starting at the top access port work downward. Orient the yoke as shown in Detail A and insert into the housing so the yoke is positioned in the appropriate holes in the tube sheet. From the filter section, have one person hold the yoke in position while another person installs a flat washer and hex nut on each yoke rod end from the clean-air plenum. Do not tighten hardware at this time.
3. Adjust jam nut against the filter cartridge panel. Have one person hold the yoke in position as shown in Detail B while another person tightens the three hex nuts from the clean-air plenum. Repeat to install all yokes.
4. Apply sealant to venturi as shown in Detail E. Slide venturi over the yoke with sealant end first. Hold venturi in place while installing venturi hardware (thread forming screws and gasket washers) from the clean-air plenum.
5. Slide the filter cartridges into the collector on the yoke gasket-end first. Replace access cover and tighten securely by hand following instructions found in Maintenance Information. Repeat for all filter cartridges.
6. Replace the outlet cover on the bottom of the clean-air plenum shown in Detail D.

## Platforms and ladders

Stationary platforms are available for each size collector.

For two filter wide models the platform is available for standard or steep-sided hoppers with the ladder located left, right, or front of the platform.

On three filter wide models the platform is available for standard hoppers only with ladder access on the left or right side only. Complete installation and assembly instructions are shipped with the platform.

*Dropping the platform can result in personal injury and/or property damage. Secure the platform assembly to the crane or forklift with straps or clamps.*

1. Pre-assemble the platform according to the instructions shipped with the platform. The hardware and placement is called out on the assembly drawing.
2. Lift the assembled platform into position and secure following the assembly drawing instructions.
3. Tighten all hardware before removing crane or forklift.
4. Check platform hardware each time the platform is used.

**Figure 11: Stationary platform**

## Control box

The controlbox is factory mounted on the hopper according to our standards (except when specified by order).

If not pre-mounted please make sure that the in-line filter is positioned correctly on the dirtyside tapping point connection to the control box (refer to figure 12 for mounting details).

All the instructions related to the controlbox are mentioned in separate manuals.

**Figure 12: Inline filter view**

## Compressed air connection

Compressed air pressure must be between 6 and 7 bar.

Be sure that all compressed air components are adequately sized to meet the maximum system requirements of 45 Nliters per pulse at max 7 bar supply pressure (= design pressure).

It is a requirement that adequate precaution is taken to avoid exceeding this pressure. A relief, safety valve, is required if the connected supply can exceed this pressure. A label is also attached to each manifold indicating manifold design details.

Compressed air supply should be both oil and moisture free.

The piping should be installed to provide a fall in the directions of the air flow to assist in the drainage. A moisture separator should be provided at the lowest point of the installation.

Purge compressed air supply lines to remove debris before connecting to the compressed air manifold.

Connect the compressed air supply line to the compressed air connection at the bottom of the dust collector.

Use thread-sealing tape or pipe sealant on all compressed air connections.

A compressed air shut-off valve, a filter/water separator with automatic condensate drain, a pressure regulator with gauge must be installed in the compressed air supply line. Locate these components for convenient service, in the immediate vicinity of the dust collector.

### Electrical connection

Amperage and voltage information is shown on the nameplate ratings of the fan motor. Over amperage of manufacturer's recommended service of motor will cause damage.

- If the fan is not premounted, connect the fan motor to the control box according wiring diagram.
- Connect the main power to the control box according the wiring diagram included in the control box.

Check the rotation of the fan wheel (direction of the arrow on the fan housing). If the fan is running in the wrong way, it will deliver only approximately 40% of its rated air volume.

Lock out all electrical input power and interchange any two wire leads (3 phase only) on the output side of the motor starter to reverse fan rotation.

### Solenoid valves

See C-series controller manual.

## Inlet plenum

---

The inlet plenum is standard on Downflo® Evolution collectors unless another inlet plenum option has been selected.

The inlet plenum directs the dirty air stream to the back of the dirty-air plenum over the venturi section.

1. Remove the unit's shipping cover plate. Remove excess sealant from opening.
2. Apply sealant around the opening toward the inside edge of the bolt pattern.
3. Align the holes on the inlet collar with the holes in the unit and secure using bolts and flat washers supplied.

**Figure 14: Inlet plenum**

## High Flow Inlet Plenum

---

The high flow inlet plenum is used in applications with higher flow rates. Please contact application engineering.

The high flow inlet plenum is supplied with standard service access panels on the front, back and top of the plenum.

The top access panel is available with and without an explosion vent.

**Figure 15: High flow inlet plenum**

### **Extended Dirty-Air Plenum**

The extended dirty-air plenum is used in applications requiring an air management module or when a single inlet serves multiple modules.

The extended dirty-air plenum is supplied with standard service access panels on the sides and top of the plenum.

The top access panel is available with and without an explosion vent.

**Figure 16: Extended Dirty-Air plenum**

## Air management module

The air management module is used in applications involving heavy grain loading, large or abrasive particles in the airstream, or in applications when a collector with a single inlet serves multiple modules. It is equipped with a louvered panel near the bottom, which prevents re-entrainment of the dust that falls through to the hopper. This module does not contain filters, and is available for use with an extended dirty-air plenum only.

**Figure 17: Air management module**

## Sprinkler

*Sprinklers can place a large quantity of water in the dust collector when activated. Provide adequate drainage to remove water. Excess water weight can cause the leg structure to collapse.*

Fire control sprinklers are available for models operating under negative pressure. Donaldson Torit supplied sprinklers require a minimum of 1 bar water pressure which will produce a discharge per sprinkler head of 77 liters per minute.

*Consult with local authorities when installing fire control systems on dust collector equipment.*

1. Remove or open the filter access covers to access the sprinkler tap located in the dirty-air plenum.
2. Apply pipe sealant to the threads of the pipe reducer located on the sprinkler assembly.
3. Thread sprinkler assembly onto the 1-in diameter sprinkler tap.
4. Tighten securely.

### Bursting panel and indicator

1. Remove protective shipping cover from top of collector (underneath is the explosion panel positioned upside-down).
2. Inspect the panel and ensure it is clean.

*Handle the panel with extreme care.*

*Check the location and system specifications correspond with the serial number and data on the panel serial plate.*

**Figure 20: Bursting panel serial plate and label**

3. Apply sealant to top flange of collector, making a continuous 5 mm bead along each side of the holes.
4. Place panel on flange (bulged side facing upwards) and align bolt holes in flanges with drift pin.
5. Bolt panel and flange together using bolts, washers and nuts supplied.

*Use washers between panel and bolts.*

*Follow the torque value specified on the panel serial plate. Torque should be applied crosswise and in a least two stages. Torque values are based on new free running bolts coated with light oil. After initial start-up, check torque values.*

6. Assemble the explosion detection device (bracket and signalling cable) and place into position. The signalling unit including cable loop must be integrated into the threaded cable connected in such way that the loop is matching the other side of the explosion panel.
7. Pull the steel cable carefully through the cable loop and fix both mounting eyes with the mounting screw (min. M10) of the vent panel.
8. Now pull the signalling unit carefully to a slight tension and tighten the threaded cable connection. The cable shall be at the crest to the dome of the panel or lead straight across in case of flat panels.

*Do not bend the stiffened part of the cable as damage could occur.*

*It is mandatory that the cable connection is pulled tight otherwise the signalling unit does not break and no alarm signal is actuated. This means that no alarm contact or plant shut off is triggered. Heavy damages (e.g. due to further transport of burning material or uncontrolled product release) can be the consequence.*

**Figure 21: Bursting panel and indicator installation**

### Bursting panel indicator switch

According VDI, each bursting panel may be combined with signalling devices which will trigger a shut down or a controlling mode. Therefore Donaldson Torit will supply a bursting disc indicator switch with each bursting disc (see scope of delivery).

When connecting the indicator switch, the following must be taken into account:

- maximum supply voltage : 30 Volt DC
- maximum current : 100 mA / 3 Watt

When the indicator is located in a hazardous area, the electrical circuit to the indicator must be intrinsically safe. (an optional isolation amplifier is a perfect solution)

*As the burst indicator is a very sensitive device, it is recommended to use always a isolation amplifier, this gives the best guarantee for TROUBLE FREE electrical functioning of the indicator.*

#### Typical wiring diagrams

*These diagrams are only for information as the wiring diagram will be different for each individual dust collector installation (depending on the configuration of the dust collector; availability of dust release system, damper valve actuator, alarm, fan, etc. and requirements of the customer).*

**Figure 23: Typical wiring diagram - hazardous area**

**Dust outlet connection**

When using rotary airlock or screw conveyor:

- A sealant must be fitted between all connecting flanges.
- Check the rotation (direction of the arrow).
- Electrical connections shall be made by a qualified electrician.

*The access to the rotor/screw or butterfly valve must be made impossible during operation.*

*See Manual of your dust disposal system.*

*Follow all steps before first start-up and when the dust collector is not been used for a long period.*

*For daily use follow steps 1, 2, 3, 5, 6 and 8.*

1. Check that the outlet of the fan is free of debris before starting.
2. Make sure the dust disposal system is properly installed under the hopper.
3. Turn on the hopper disposal system (where so equipped and on a separate control). The direction of rotation must be checked. The system must always be operating when the dust collector is operating.

*Too much airflow can cause electrical failure of the fan motor or dramatically reduce the life of the filter cartridges.*

4. Check if the damper valve is 50% closed.
5. Check if the covers are closed.
6. Switch main power on.
7. Check the airflow with a pitot tube and a micro-manometer in the ductwork and adjust the damper valve to the desired airflow.
8. Turn on the compressed air supply. Adjust to 6.5 bar of pressure with the compressed air regulator.

*Do not increase compressed air pressure beyond 7 bar as component damage may result.*

The cleaning cycle only starts when necessary. For customized settings see the controls manual.

## SERVICE

---

*Disconnect electrical power before servicing.*

*Shut off and bleed compressed air supply before servicing any compressed air components.*

*No welding should be performed inside without fire protection.*

*Avoid contact or exposure to dust during servicing or maintenance.*

### Dust removal

---

*Do not let the dustbin overfill. It can cause poor dust collector performance.*

1. Turn off the dust collector and empty the dust disposal on a regular base (recommended to empty the dustbin when 3/4 full).
2. If the hopper has a butterfly valve, close before servicing the dust bin. Remove and empty the bin.
3. Reinstall the bin and open the valve. The fan does not have to be shut off if this procedure is followed.

### Change of filter cartridges

---

(see figure 25 - Exchanging filter cartridge)

#### Filter cartridge removal

*All filter cartridges should be changed at the same time.*

*Dust laden filters may be heavy and difficult to handle. Provide appropriate means of access to replace filter cartridges safely in case no platform is installed.*

*Generally filter cartridges cannot be washed and re-used. Only non-cellulose based media types can in some instances be cleaned with water, but contact your Donaldson Torit representative before doing so.*

1. Turn off power to the collector.
2. Begin filter cartridge replacement at one of the top filter access ports. Continue by replacing the remaining filter cartridges in the top row. Proceed to replace filter cartridges in the next rows. Replacing filter cartridges row by row starting at the top will help limit dusting during replacement.
3. Remove access cover by turning knob counterclockwise.

*Do not use the access cover features as climbing equipment. Use safe practices for maintenance and installation.*

*The genuine Donaldson Torit filter cartridge is the only replacement filter that will provide the high level of performance that you expect from your investment in the Donaldson Torit dust collector.*

*Do not drop or rap the new filter cartridge on the floor or any other hard surface. Damage to the filter cartridge will occur, resulting in leakage. It is necessary to clean the dust off of the tube sheet all around the opening to ensure a positive seal of the filter gasket.*

4. Break the seal between the filter cartridge and the sealing surface.
5. Slide each filter cartridge out the access port along the suspension yoke and dispose of properly.
6. Inspect and clean the sealing surface if necessary.
7. Clean any dust from the yoke threads that may have accumulated during the filter removal.
8. Check for any accumulation of dust in the storage area and remove as necessary.

*If the gasket is damaged the cover has to be replaced.*

*Lack of compression of the filter gaskets can cause leakage.*

### Filter cartridge installation

1. Slide the gasket end of each new filter onto the end of the suspension yoke.

*The filter shape and yoke work together to ensure proper filter alignment during filter installation. To assist with alignment, an alignment mark ( $\Delta$ ) at the top of the filter endcap (non-gasketed end) must match with the alignment mark ( $\nabla$ ) at the top of the filter access opening.*

2. Inspect cover gaskets. Clean and/or replace as necessary.
3. After new filter cartridges have been installed, place the access cover on the yoke and hold it in position while tightening the knob securely by hand (3 turns) before using tool assist option.
4. If knob fails to thread onto yoke, on the opposite side of the hinge, apply slight pressure to the access cover using other hand. Continue to turn knob to start threading onto the yoke.

*The access cover must be properly aligned to ensure a dust tight seal to the housing.*

*Do not exceed 17 N\*m (150 inch\*lb) tightening torque to secure access cover as over tightening may cause damage to the filter and/or equipment.*

*After securing the access cover check that access cover is properly seated and sealed against the collector cabinet front panel (a.k.a. access panel). If access cover is properly seated it will seal correctly with no more than 150 in\*lb tightening torque.*

## Diaphragm valve

---

### Valve disassembly

Disassemble in an orderly fashion. Pay careful attention to exploded views provided for identification of parts.

1. Remove the clipping from the valve body to remove the bonnet. Use a screwdriver on 3 places at the bonnet, start removing the clipping on the inlet side. Then remove the piston/diaphragm assembly.
2. Remove pipes if necessary and in that case remove the pipe o-rings from the body with a suitable device.
3. All parts are now accessible for cleaning or replacement.

### Valve reassembly

Reassemble in reverse order of disassembly paying careful attention to exploded views provided for identification and placement of parts.

*Lubricate all gaskets and o-rings with high quality silicone grease.*

1. Replace piston/diaphragm-assembly.

*Locate bleedhole in piston/diaphragm opposite to the valve inlet for the best performance.*

2. Replace the clipping on the body, with the open end towards the inlet side of the body. The legs of the clipping should point outwards from the valve and they should be evenly spaced from the stop in the groove.
3. Replace the bonnet by pressing it firmly against the piston/diaphragm. Use pliers to press the ends of the clipping together.
4. Replace pipe o-rings, then slip the clamp o-rings over the inlet pipe. Replace the valve on the pipe and move the clamp o-ring over the pipe against the valve body. Replace the clamps and torque the clamp screws according to torque chart (16 Nm  $\pm$  2Nm). The clamp o-ring is necessary to fixate the valve in place.
5. After maintenance, operate the valve a few times to be sure of proper operation.

## SUPPLEMENTARY INFORMATION

---

### **ATEX (2014/34/EU)**

Please read this information carefully before commencing any work. Product reliability, warranty and safe operation may be compromised by not following the guidance given in these documents.

1. The dust collector should be used only when it is in a technically acceptable condition. Regular maintenance, as set out in this manual, is required to minimise technical failure. Third party supplied components (for example motors) should be maintained according to the manufacturer's instructions.
2. In order to maintain the original collector specification and to ensure the same level of safety, only genuine spare parts should be fitted.
3. You should ensure any persons carrying out work on the supplied equipment follow any relevant recognised standards/codes and are competent to do so. Areas requiring a competent person include:
  - Maintenance on any component identified as a potential ignition source.
  - Lifting and erection.
  - Electrical installation, inspection and maintenance work.
  - Pneumatic installation, inspection and maintenance work.
  - Any access to internal classified Potentially Explosive Atmospheres where the risks due to explosion and dust contact are reduced to a safe level.

During assembly/installation or dismantling of equipment, potential ignition sources may occur that were not considered in the risk assessment of the unit in operation (for example, grinding, welding sparks, etc.)

4. You should use the dust collector in full accordance with the conditions set out in the Order Acknowledgment or relevant Scope of Delivery. Failure to do so may compromise product reliability, warranty and safety.
5. Other items of equipment, not supplied under the Scope of Delivery from Donaldson Torit, should be installed, operated and maintained according to the documentation supplied with the respective equipment.
6. Before any work is carried out, ensure the equipment is adequately isolated.
7. Where necessary for safety, the dust collector is fitted with fixed guards. Removal of these guards and any subsequent work should only be carried out after adequate precaution is taken to ensure it is safe to do so. All guards should be refitted before re-energising.
8. Ensure the pneumatic system is fully isolated and depressurised before any work is carried out.
9. Access to the dirty air chamber of the equipment may create risks and hazards that under normal circumstances are not present and as such this work must be carried out by competent personnel. These risks include inhalation of dust and potential explosion hazards.
10. The equipment supplied is suitable for working within a Potentially Explosive Atmosphere (as defined by Directive 2014/34/EU) according to the categories and conditions marked on the collector serial nameplate. You should ensure the equipment supplied by others is also suitable. If no marking is given on the serial nameplate then the supplied equipment is not suitable for use in Potentially Explosive Atmospheres.
11. Care should be taken to ensure that any explosive atmosphere is not present when performing operations that increase the risk of ignition (opening of controller for adjustment or electrical repair for example). Ensure the installation is always returned to its original state.

12. If it is unavoidable to work on the equipment while an explosive atmosphere is present, care should be taken to avoid introducing ignition sources not present during the expected operation. Non-sparking tools should be used.
13. Where equipment is installed in a Potentially Explosive Atmosphere, care should be taken not to locate the collector where external ignition sources can be introduced, for example stray electric currents, lightening, electromagnetic waves, ionising radiation, ultrasonic waves.
14. Where the dust being processed can ignite due to exothermic reaction, including self ignition, the collector **MUST** be fitted with a suitable explosion protection method (venting for example). The risk of ignition can be minimised by avoiding the accumulation of dust layers with regular cleaning.
15. Every care has been taken to avoid the risk of ignition. The measures taken to avoid ignition should not be altered since this may result in unsafe operation. Particular care should be taken during maintenance and component replacement to ensure the same level of safety is maintained. When replacing fan impellers, avoid any rubbing of components (to prevent mechanical sparks).
16. This dust collector may be fitted with explosion protection in the form of a vent panel. Precautions, as set out in the Scope of Delivery, are used to minimise the risk of ignition of any dust clouds contained within the dust collector. The possibility of other ignition sources being introduced into the collector during periods where any dust cloud may be present should be minimised. Particular care should be taken to avoid introducing glowing particles via the collector inlet ducting.
17. The explosion vent panel, where fitted, has been designed to provide adequate safety from an explosion initiated from within the collector, for the given dust explosion characteristics and collector arrangement as set out in the Scope of Delivery. You should ensure that explosions are not allowed to propagate into the dust collector (using suitable isolation devices) since pressures may be generated leading to unsafe equipment rupture.
18. Where applicable, equipment connected to the dust collector (for example, a cyclone) should be protected, using suitable isolation devices, against the transfer of flame and pressure if, in the event of an explosion initiating inside the dust collector, the connected equipment is not capable of safely withstanding these effects.
19. The explosion venting device, where fitted to the dust collector, is not suitable for use with dusts that are classified as poisonous, corrosive, irritant, carcinogenic, teratogenic or multigenic unless the dust released during the explosion venting process can be contained to a safe level.
20. Where applicable, care is required when siting the dust collector to ensure that the effects (flame, pressure, noise and fire) produced during and after the explosion venting process do not put at risk personnel and nearby plant.
21. In order to ensure the required venting efficiency is maintained, the explosion vent panel, if fitted to the collector, should not be obstructed in any way.
22. Any modification carried out on the 'as supplied' equipment may reduce reliability and safety, and will nullify warranty; such actions fall outside the responsibility of the original supplier.
23. On a day to day basis there is minimal interaction between the operator and the collector, however dust containers may require regular emptying. If the dust being handled is explosive, then care should be taken to ensure that dust spillage is kept to a minimum to avoid the creation of potentially explosive atmospheres and secondary hazards. Dust containers should be securely replaced and resealed prior to collector restart. This is a good time to check the dust container for damage, which may lead to a dust leak or flame emission in the rare instance of an internal explosion.

24. Compressed air is recommended for collectors that operate using reverse jet cleaning. Alternative gases should be assessed before use to ensure that explosive atmospheres are not introduced during media cleaning.
25. It may be necessary to provide a facility to shut down the equipment in the event of an explosion (where collectors are fitted with explosion relief panels). The signal should be taken from the bursting panel detection device.
26. Care should be taken during cleaning and maintenance to avoid creating static discharges that have the potential to ignite a flammable atmosphere.
27. Earthing of the equipment is an integral safety feature. Regular checks should be made (annually) to ensure continuity.

Lead compounds may cause testicular damage, sterility, sperm abnormalities, menstrual disorders, adverse effects on general reproductive performance in human. Passes through the placental barrier (can cause birth defects, postnatal development injury, increased foetal lethality and delayed foetal development.). Prolonged or repeated exposure to crystalline silica may cause silicosis, a disabling pulmonary fibrosis characterized by fibrotic changes and miliary nodules in the lungs, a dry cough, shortness of breath, emphysema, decreased chest expansion, and increased susceptibility to tuberculosis. In advanced stages, loss of appetite, pleuritic pain, and total incapacity to work. Advanced silicosis may result in death due to cardiac failure or destruction of the lung tissue. IARC - Group 2A (probably carcinogenic to humans) and "sufficient evidence" of carcinogenicity by the NTP. Medical conditions which may be aggravated: Individuals with preexisting diseases of the nerve or circulatory disorders, pulmonary/respiratory system (bronchitis, emphysema, etc.) or with skin or eye problems may be more susceptible to the effects of this product. ## SECTION 10: Stability and reactivity

### 10.1 Reactivity

sensitive to shock

The following applies in general to flammable organic substances and mixtures: in correspondingly fine distribution, when whirled up a dust explosion potential may generally be assumed.

Forms explosive mixtures with air on intense heating.

A range from approx. 15 Kelvin below the flash point is to be rated as critical.

The following applies in general to flammable organic substances and mixtures: in correspondingly fine distribution, when whirled up a dust explosion potential may generally be assumed.

### 10.2 Chemical stability

heat-sensitive

The product is chemically stable under standard ambient conditions (room temperature) .

Contains the following stabilizer(s):

water (>=30 - <=40 %)

### 10.3 Possibility of hazardous reactions

No data available

### 10.4 Conditions to avoid

Picric acid forms salts with many metals some of which are rather sensitive to heat, friction, or impact, e.g., lead, iron, zinc, nickel, copper, etc., and should be considered dangerously sensitive. The salts formed with ammonia and amines, and the molecular complexes with aromatic hydrocarbons, etc, are in general not so sensitive. Contact of picric acid with concrete floors may form the friction-sensitive calcium salt. Dry mixtures of picric acid and aluminum powder are inert, but the addition of water causes ignition after a delay dependent upon the quantity added. Storage conditions: records of purchase dates should be maintained for each container. Material older than 2 years should be disposed. Inspect and add water every six months as needed. Rotate containers to distribute water every three months.

Avoid shock and friction.

Heating (explosive decomposition).

Strong heating.

### 10.5 Incompatible materials

Strong bases, Reducing agents, Heavy metals, Heavy metal salts, Ammonia various plastics

### 10.6 Hazardous decomposition products

In the event of fire: see section 5

Inhalation of high concentrations of dust has caused unconsciousness, weakness, muscle pain, and kidney problems. Swallowing picric acid may cause a bitter taste, headache, dizziness, nausea, vomiting, and diarrhea. High doses may cause destruction of the red blood cells and damage to the kidneys and liver with blood in the urine.

CAS No.	7778-50-9

## SECTION 4: First aid measures

### 4.1 General information

IF exposed: Immediately call a POISON CENTER/doctor. If unconscious place in recovery position and seek medical advice. Never give anything by mouth to an unconscious person or a person with cramps. Change contaminated, saturated clothing. Do not leave affected person unattended.

#### In case of inhalation

Immediately call a POISON CENTER/doctor. Remove casualty to fresh air and keep warm and at rest. If breathing is irregular or stopped, administer artificial respiration.

Disposal of this product, solutions and any by-products should at all times comply with the requirements of environmental protection and waste disposal legislation and any regional local authority requirements. Dispose of surplus and non-recyclable products via a licensed waste disposal contractor. Waste should not be disposed of untreated to the sewer unless fully compliant with the requirements of all authorities with jurisdiction. Waste packaging should be recycled. Incineration or landfill should only be considered when recycling is not feasible. This material and its container must be disposed of in a safe way. Care should be taken when handling emptied containers that have not been cleaned or rinsed out. Empty containers or liners may retain some product residues. Avoid dispersal of spilled material and runoff and contact with soil, waterways, drains and sewers.

**NOSE AND THROAT**

If these become irritated move to a dust free area, drink water and blow nose.

If symptoms persist, seek medical advice.

**8. EXPOSURE CONTROLS/PERSONAL PROTECTION**

**(a) OSHA permissible exposure limit (PEL), American Conference of Governmental Industrial Hygienists (ACGIH) Threshold Limit Value (TLV), and any other exposure limit used or recommended by the chemical manufacturer, importer, or employer preparing the safety data sheet, where available**

<u>Components</u>	<u>OSHA PEL</u>	<u>NIOSH REL</u>	<u>ACGIH TLV</u>	<u>MANUFACTURER REG</u>
Refractory Ceramic Fiber (RCF)	None established*	0.5 f/cc, 8-hr. TWA	0.2 f/cc TLV, 8-hr. TWA	0.5 f/cc, 8-hr. TWA**
Metal alloy wire	None established		None established.	None established
Continuous filament fiberglass	1 f/cc TWA		1 f/cc TWA HSPP	None established
Polypropylene homopolymer	5 mg/m <sup>3</sup> PEL (resp. fraction), 15 mg/m <sup>3</sup> PEL (total dust) as PNOR		PNOC -- 10 mg/m <sup>3</sup> (total dust), 3 mg/m <sup>3</sup> (respirable fraction)	None established

\*Except for the state of California, where the PEL for RCF is 0.2 f/cc 8-hr TWA, there is no specific regulatory standard for RCF in the U.S. OSHA's "Particulate Not Otherwise Regulated (PNOR)" standard [29 CFR 1910.1000, Subpart Z, Air Contaminants] applies generally - Total Dust 15 mg/m<sup>3</sup>; Respirable Fraction 5 mg/m<sup>3</sup>.

\*\*In the absence of an OSHA PEL, HTIW Coalition has adopted a recommended exposure guideline (REG), as measured under NIOSH Method 7400 B. For further information on the history and development of the REG see "Rationale for the Recommended Exposure Guideline" at page 34 of the HTIW Coalition Product Stewardship Program [http://www.htiwcoalition.org/documents/PSP\\_2012.pdf](http://www.htiwcoalition.org/documents/PSP_2012.pdf).

**OTHER OCCUPATIONAL EXPOSURE LEVELS (OEL)**

RCF-related occupational exposure limits vary internationally. Regulatory OEL examples include: California, 0.2 f/cc; Canadian provincial OELs ranging from 0.2 to 1.0 f/cc. The objectives and criteria underlying each of these OEL decisions also vary. The evaluation of occupational exposure limits and determining their relative applicability to the workplace is best performed, on a case-by-case basis, by a qualified Industrial Hygienist.

**(b) Appropriate engineering controls**

Use engineering controls such as local exhaust ventilation, point of generation dust collection, down draft work stations, emission controlling tool designs, and materials handling equipment designed to minimize airborne fiber emissions.

### (c) Individual protection measures, such as personal protective equipment

#### Skin Protection

Wear personal protective equipment (e.g. gloves), as necessary to prevent skin irritation. Washable or disposable clothing may be used. If possible, do not take unwashed clothing home. If soiled work clothing must be taken home, employees should be informed on best practices to minimize non-work dust exposure (e.g., vacuum clothes before leaving the work area, wash work clothing separately, and rinse washer before washing other household clothes).

#### Eye Protection

As necessary, wear goggles or safety glasses with side shields.

#### Respiratory Protection

When engineering and/or administrative controls are insufficient to maintain workplace concentrations below the 0.5 f/cc REG or a regulatory OEL, the use of appropriate respiratory protection, pursuant to the requirements of OSHA Standards 29 CFR 1910.134 and 29 CFR 1926.103, is recommended. A NIOSH certified respirator with a filter efficiency of at least 95% should be used. The 95% filter efficiency recommendation is based on NIOSH respirator selection logic sequence for exposure to manmade mineral fibers. Pursuant to NIOSH recommendations, N-95 respirators are appropriate for exposures up to 10 times the NIOSH Recommended Exposure Limit (REL). With respect to RCF, both the NIOSH REL and the industry REG have been set at 0.5 fibers per cubic centimeter of air (f/cm<sup>3</sup>). Accordingly, N-95 would provide the necessary protection for exposures up to 5 f/cm<sup>3</sup>. Further, the Respirator Selection Guide published by 3M Corporation, the primary respirator manufacturer, specifically recommends use of N-95 respirators for RCF exposures. In cases where exposures are known to be above 5.0 f/cm<sup>3</sup>, 8 hour TWA, a filter efficiency of 100% should be used. Other factors to consider are the NIOSH filter series N, R or P -- (N) Not resistant to oil, (R) Resistant to oil and (P) oil Proof. These recommendations are not designed to limit informed choices, provided that respiratory protection decisions comply with 29 CFR 1910.134.

The evaluation of workplace hazards and the identification of appropriate respiratory protection is best performed, on a case by case basis, by a qualified Industrial Hygienist.

#### Other Information

- Concentrations based upon an eight-hour time weighted average (TWA) as determined by air samples collected and analyzed pursuant to NIOSH method 7400 (B) for airborne fibers.
- The manufacturer recommends the use of a full-facepiece air purifying respirator equipped with an appropriate particulate filter cartridge during furnace tear-out events and the removal of used RCF to control exposures to airborne fiber and the potential presence of crystalline silica.

## 11. TOXICOLOGICAL INFORMATION

For more details on scientific publications referenced in this SDS see <http://www.htiwcoalition.org/publications.html>

### (a) through (d)

#### TOXICOKINETICS, METABOLISM AND DISTRIBUTION

##### Basic Toxicokinetics

Exposure is predominantly by inhalation or ingestion. Man-made vitreous fibers of a similar size to RCF have not been shown to migrate from the lung and/or gut and do not become located in other organs of the body.

##### Human Toxicological Data/Epidemiology Data

In order to determine possible human health effects following RCF exposure, the University of Cincinnati has been conducting medical surveillance studies on RCF workers in the U.S.A; this epidemiological study has been ongoing for 25 years and medical surveillance of RCF workers continues. The Institute of Occupational Medicine (IOM) has conducted medical surveillance studies on RCF workers in European manufacturing facilities.

Pulmonary morbidity studies among production workers in the U.S.A. and Europe have demonstrated an absence of interstitial fibrosis. In the European study a reduction of lung capacity among smokers has been identified, however, based on the latest results from a longitudinal study of workers in the U.S.A. with over 17-year follow-up, there has been no accelerated rate of loss of lung function (McKay et al. 2011).

A statistically significant correlation between pleural plaques and cumulative RCF exposure was evidenced in the U.S.A. longitudinal study.

The U.S.A. mortality study showed no excess mortality related to all deaths, all cancer, or malignancies or diseases of the respiratory system including mesothelioma (LeMasters et al. 2003).

##### Information on Toxicological Effects

- *Acute toxicity: short term inhalation*  
No data available: Short term tests have been undertaken to determine fiber (bio) solubility rather than toxicity; repeat dose inhalation tests have been undertaken to determine chronic toxicity and carcinogenicity.
- *Acute toxicity: oral*  
No data available: Repeated dose studies have been carried out using gavage. No effect was found.
- *Skin corrosion/irritation*  
Not a chemical irritant according to test method OECD no. 404.
- *Serious eye damage/irritation*  
Not possible to obtain acute toxicity information due to the morphology and chemical inertness of the substance.
- *Respiratory or skin sensitization*  
No evidence from human epidemiological studies of any respiratory or skin sensitization potential.

- *Germ cell mutagenicity/genotoxicity*  
Method: In vitro micronucleus test  
Species: Hamster (CHO)

Dose: 30 mg/m<sup>3</sup>  
Routes of administration: Nose only inhalation  
Results: Hamsters were exposed to a single concentration of 260 WHO fibers/ml specially prepared RCF for 18 months and developed lung fibrosis, a significant number of pleural mesotheliomas (42/102) but no primary lung tumors (McConnell et al 1995).

Method: Inhalation, single dose  
Species: Rat  
Dose: RCF1: 130 F/ml and 50 mg/m<sup>3</sup> (25% of non fibrous particles)  
RCF1a: 125 F/ml and 26 mg/m<sup>3</sup> (2% of non fibrous particles)  
Routes of administration: Nose only inhalation  
Results: Rats were exposed to RCF1 and RCF1a for 3 weeks. The objective of the study was to compare lung retention and biological effects of the original RCF1 compared to RCF1a. The main difference of these 2 samples was the non-fibrous particle content of respectively 25% versus 2%. The post treatment observation was 12 months. Alveolar clearance was barely retarded after RCF1A exposure. After RCF1 exposure, however, a severe retardation of clearance was observed. (Bellmann et al 2001).

After intraperitoneal injection of ceramic fibers into rats in three experiments (Smith et al 1987, Pott et al 1987, Davis et al 1984), mesotheliomas were found in the abdominal cavity in two studies, while the third report (Pott et al 1987) had incomplete histopathology. Only a few mesotheliomas were found in the abdominal cavity of hamsters after intraperitoneal injection in one experiment (Smith et al 1987). However, the ceramic fibers tested were of relatively large diameter. When rats and hamsters were exposed via intraperitoneal injection, tumor incidence was related to fiber length and dose (Smith et al 1987, Pott et al 1987, Miller et al 1999, Pott et al 1989). (From SCOEL publication (EU Scientific Committee on Occupational Exposure Limits) SCOEL/SUM/165, September 2011).

- *Reproductive toxicity*  
Method: Gavage  
Species: Rat  
Dose: 250mg/kg/day  
Routes of administration: Oral  
Results: No effects were seen in an OECD 421 screening study. There are no reports of any reproductive toxic effects of mineral fibers. Exposure to these fibers is via inhalation and effects seen are in the lung. Clearance of fibers is via the gut and the feces, so exposure of the reproductive organs is extremely unlikely.

See the following review publications for a summary and discussion:

Interpretation of these animal experiments is complex and there is not complete agreement amongst scientists internationally. A summary of the evidence relating to RCF carcinogenicity in vivo can be found in SCOEL/SUM/165 and in Utell and Maxim 2010.

Other information

Numerous studies indicate the relevance of biopersistence as a determinant of toxic effects of fiber exposure. (Maxim et al 2006).

**Irritant Properties**

Negative results have been obtained in animal studies (EU method B 4) for skin irritation. Inhalation exposures using the nose only route produce simultaneous heavy exposures to the eyes, but no reports of excess eye irritation exist. Animals exposed by inhalation similarly show no evidence of respiratory tract irritation.

Human data confirm that only mechanical irritation, resulting in itching, occurs in humans. Screening at manufacturers' plants in the UK has failed to show any human cases of skin conditions related to fiber exposure.

**(e) International Agency for Research on Cancer and National Toxicology Program**

IARC, in 1988, Monograph v.43 (and later reaffirmed in 2002, v.81), classified RCF as possibly carcinogenic to humans (group 2B). IARC evaluated the possible health effects of RCF as follows:

- There is inadequate evidence in humans for the carcinogenicity of RCF.
- There is sufficient evidence in experimental animals for the carcinogenicity of RCF.

The Annual Report on Carcinogens (latest edition), prepared by NTP, classified respirable RCF as "reasonably anticipated" to be a carcinogen).

Not classified by OSHA.

## **INTERNATIONAL REGULATIONS**

**Canada**      **Canadian Workplace Hazardous Materials Information System (WHMIS)** – Classified as Class D2A – Materials Causing Other Toxic Effects  
**Canadian Environmental Protection Act (CEPA)** - All substances in this product are listed, as required, on the Domestic Substance List (DSL)

**Europe**      **Integration of RCF into ANNEX XV of the REACH Regulation**

RCF is classified under the CLP (classification, labelling and packaging of substances and mixtures) regulation as a category 1B carcinogen. On January 13, 2010 the European Chemicals Agency (ECHA) updated the candidate list for authorization (Annex XV of the REACH regulation) and added 14 new substances in this list including aluminosilicate refractory ceramic fibers.

As a consequence, EU (European Union) or EEA (European Economic Area) suppliers of articles which contain aluminosilicate refractory ceramic fibers in a concentration above 0.1% (w/w) have to provide sufficient information, available to them, to their customers or upon requests to a consumer within 45 days of the receipt of the request. This information must ensure safe use of the article, and as minimum contains the name of the substance.

## **16. OTHER INFORMATION**

### **Product Stewardship Program**

Unifrax I LLC has established a program to provide customers with up-to-date information regarding the proper use and handling of refractory ceramic fiber. In addition, Unifrax has also established a program to monitor airborne fiber concentrations at customer facilities. If you would like more information about this program, please call the Product Stewardship Information Hotline at 1-800-322-2293.

In 2002, OSHA endorsed a five year voluntary product stewardship program called PSP 2002. On May 23, 2007, HTIW Coalition's predecessor, RCFC, and its member companies renewed this voluntary product stewardship agreement with OSHA. On April 16, 2012, HTIW Coalition renewed this agreement.

This new five year program, called PSP 2012, continues and builds upon the earlier programs. PSP 2012 is a highly acclaimed, multifaceted strategic risk management initiative designed specifically to reduce workplace exposures to refractory ceramic fiber (RCF). For more information regarding PSP 2012, please visit <http://www.htiwcoalition.org>

### **Additional Information on After Service Material**

As produced, all RCF fibers are vitreous (glassy) materials which do not contain crystalline silica. Continued exposure to elevated temperatures may cause these fibers to devitrify (become crystalline). The first crystalline formation (mullite) begins to occur at approximately 985° C (1805° F). Crystalline phase silica may begin to form at approximately 1100° C (2012° F). When the glass RCF fibers devitrify, they form a mixed mineral crystalline silica containing dust. The crystalline silica is trapped in grain boundaries within a matrix predominately consisting of mullite. The occurrence and extent of crystalline phase formation is dependent on the duration and temperature of exposure, fiber chemistry and/or the presence of fluxing agents or furnace contaminants. The presence of crystalline phases can be confirmed only through laboratory analysis of the "hot face" fiber.

IARC's evaluation of crystalline silica states "Crystalline silica inhaled in the form of quartz or cristobalite from occupational sources is carcinogenic to humans (Group 1)" and additionally notes "carcinogenicity in humans was not

detected in all industrial circumstances studied." IARC also studied mixed mineral crystalline silica containing dusts such as coal dusts (containing 5 – 15 % crystalline silica) and diatomaceous earth without seeing any evidence of disease. (IARC Monograph Vol. 68, 1997). NTP lists all polymorphs of crystalline silica amongst substances which may "reasonably be anticipated to be carcinogens".

IARC and NTP did not evaluate after-service RCF, which may contain various crystalline phases. However, an analysis of after-service RCF samples obtained pursuant to an exposure monitoring agreement with the USEPA, found that in the furnace conditions sampled, most did not contain detectable levels of crystalline silica. Other relevant RCF studies found that (1) simulated after-service RCF showed little, or no, activity where exposure was by inhalation or by intraperitoneal injection; and (2) after-service RCF was not cytotoxic to macrophage-like cells at concentrations up to 320 micrograms/cm<sup>2</sup> - by comparison, pure quartz or cristobalite were significantly active at much lower levels (circa 20 micrograms/cm<sup>2</sup>).

### Section 4. First Aid Measures

<b>General Advice</b>	Treat symptomatically and supportively.
<b>If Inhaled</b>	Get medical aid immediately, remove from exposure and move to fresh air immediately. If breathing is difficult, give oxygen. Do not use mouth-to-mouth resuscitation if the victim ingested or inhaled the substance; induce artificial respiration with the aid of a pocket mask equipped with a one-way valve or other proper respiratory medical device.
<b>In Case of Skin Contact</b>	Get medical aid immediately. Immediately flush skin with plenty of water for at least 15 minutes while removing contaminated clothing and shoes. Wash clothing before reuse. Destroy contaminated shoes.
<b>In Case of Eye Contact</b>	Immediately flush eyes with plenty of water for at least 15 minutes, occasionally lifting the upper and lower eyelids. Get medical aid immediately. Do NOT allow the victim to rub eyes or keep eyes closed. Extensive eye irrigation with water is required (at least 30 minutes).
<b>If Swallowed</b>	Never give anything by mouth to an unconscious person. Get medical aid immediately. Induce vomiting. If conscious and alert, rinse the mouth and drink 2-4 cups of mild or water.
<b>Indication of Any Immediate Medical Attention and Special Treatment Needed</b>	No data available

**Danger:** May cause cancer by inhalation. Causes damage to lungs through prolonged or repeated exposure by inhalation.

**Response:** If medical condition persisted, get medical advice.

**Disposal:** Dispose of contents/containers in accordance with local regulation

**Prevention:** Do not handle until all safety precautions have been read and understood. Do not breathe dust. Do not eat, drink or smoke when using this product. Wear protective gloves and safety glasses or goggles. In case of inadequate ventilation wear respiratory protection.

### 3. COMPOSITION / INFORMATION ON INGREDIENTS

Component CAS No. Percent Crystalline Silica (quartz) 14808-60-7 95-99.9

### 4. FIRST-AID MEASURES

**Inhalation:** First aid is not generally required. If irritation develops from breathing dust, move the person from the overexposure and seek medical attention if needed.

**Skin contact:** First aid is not required.

**Eye contact:** Wash immediately with plenty of water. Do not rub eyes. Particulates may cause abrasive eye injury. If irritation persists, seek medical attention.

**Ingestion:** First aid is not required. Most important symptoms/effects, acute and delayed:

**Inhalation** of dust may cause respiratory tract irritation. Symptoms of exposure may include cough, sore throat, nasal congestion, sneezing, wheezing and shortness of breath.

**Prolonged inhalation of respirable crystalline silica** above certain concentrations may cause lung diseases, including silicosis and lung cancer.

**Indication of immediate medical attention and special treatment, if necessary:**  
Immediate medical attention is not required.

### 5. Firefighting Measures

**Flammability:** Non-Flammable

**Flash Point:** Not Applicable

**Auto-Ignition Temperature:** Not Applicable

**Hazardous Combustion Products:** Not Applicable

**Fire Hazards in the Presence of Various Substances:** Not flammable

**Extinguishing Agents:** No special suppressants are required

**Protective Equipment:** No special measures required

## 6. Accidental Release Measures

**Personal precautions, protective equipment, and emergency procedures:** Wear appropriate protective clothing and respiratory protection (see Section 8 below). Avoid generating airborne dust during clean-up.

**Environmental precautions:** No specific precautions. Report releases to regulatory authorities if required by local, state and federal regulations.

**Methods and materials for containment and cleaning up:** Avoid dry sweeping. Do not use compressed air to clean spilled sand or ground silica. Use water spraying/flushing or ventilated or HEPA filtered vacuum cleaning system, or wet before sweeping. Dispose of in closed containers.

## 7. Handling and storage

**Precautions for safe handling:** Avoid generating dust. Do not breathe dust. Do not rely on your sight to determine if dust is in the air. Respirable crystalline silica dust may be in the air without a visible dust cloud. Use adequate exhaust ventilation and dust collection to reduce respirable crystalline silica dust levels to below the permissible exposure limit ("PEL"). Maintain and test ventilation and dust collection equipment. Use all available work practices to control dust exposures, such as water sprays. Practice good housekeeping. Do not permit dust to collect on walls, floors, sills, ledges, machinery, or equipment. Keep airborne dust concentrations below permissible exposure limits.

Where necessary to reduce exposures below the PEL or other applicable limit (if lower than the PEL), wear a respirator approved for silica containing dust when using, handling, storing or disposing of this product or bag. See Section 8, for further information on respirators. Do not alter the respirator. Do not wear a tight-fitting respirator with facial hair such as a beard or mustache that prevents a good face to face

piece seal between the respirator and face. Maintain, clean, and fit test respirators in accordance with applicable standards. Wash or vacuum clothing that has become dusty.

Participate in training, exposure monitoring, and health surveillance programs to monitor any potential adverse health effects that may be caused by breathing respirable crystalline silica. The OSHA Hazard Communication Standard, 29 CFR Sections 1910.1200, 1915.1200, 1917.28, 1918.90, 1926.59 and 1928.21, and state and local worker or community "right-to-know" laws and regulations should be strictly followed.

Do Not Use U.S. Mine Corporation Sand for Sand Blasting

**Conditions for safe storage, including any incompatibilities:** Use dust collection to trap dust produced during loading and unloading. Keep containers closed and store bags to avoid accidental tearing, breaking, or bursting.

## 8. Exposure Controls/Personal Protection

### **Exposure guidelines:**

Component	OSHA PEL	ACGIH TLV	NIOSH REL
Crystalline Silica (quartz)	<u>10mg/m<sup>3</sup></u> %SiO <sub>2</sub> +2 TWA (respirable dust)	0.025 mg/m <sup>3</sup> TWA (respirable dust)	0.05 mg/m <sup>3</sup> TWA (respirable dust)
	<u>30 gm/m<sup>3</sup></u> %SiO <sub>2</sub> + 2 TWA (total dust)		

**Appropriate engineering controls:** Use adequate general or local exhaust ventilation to maintain concentrations in the workplace below the applicable exposure limits listed above.

**Respiratory protection:** If it is not possible to reduce airborne exposure levels to below the OSHA PEL or other applicable limit with ventilation, use the table below to assist you in selecting respirators that will reduce personal exposures to below the OSHA PEL. This table is part of the NIOSH Respirator Selection Logic, 2004, Chapter III, Table 1, "Particulate Respirators". The full document can be found at [www.cdc.gov/niosh/npptl/topics/respirators](http://www.cdc.gov/niosh/npptl/topics/respirators); the user of this SDS is directed to that site for information concerning respirator selection and use. The assigned protection factor

(APF) is the maximum anticipated level of protection provided by each type of respirator worn in accordance with an adequate respiratory protection program. For example, an APF of 10 means that the respirator should reduce the airborne concentration of a particulate by a factor of 10, so that if the workplace concentration of a particulate was 150 ug/m<sup>3</sup>, then a respirator with an APF of 10 should reduce the concentration of particulate to 15 ug/m<sup>3</sup>. In using chemical cartridges, consideration must be given to selection of the correct cartridge for the chemical exposure and the maximum use concentration for the cartridge. In addition a cartridge change-out schedule must be developed based on the concentrations in the workplace.

Assigned protection factor 1	<b>Type of Respirator</b> (Use only NIOSH-certified respirators)
10	Any air-purifying elastomeric half-mask respirator equipped with appropriate type of particulate filter. <sup>2</sup> Appropriate filtering facepiece respirator. <sup>2,3</sup> Any air-purifying full facepiece respirator equipped with appropriate type of particulate filter. <sup>2</sup> Any negative pressure (demand) supplied-air respirator equipped. with a half mask.
25	Any powered air-purifying respirator equipped with a hood or helmet and a high efficiency (HEPA) filter. Any continuous flow supplied-air respirator equipped with a hood or helmet
50	Any air-purifying full facepiece respirator equipped with N-100, R-100, or P-100 filter(s). Any powered air-purifying respirator equipped with a tight-fitting facepiece (half or full facepiece) and a high-efficiency filter. Any negative pressure (demand) supplied-air respirator equipped with a full facepiece. Any continuous flow supplied-air respirator equipped with a tight fitting facepiece (half or full facepiece) Any negative pressure (demand) self-contained respirator equipped with a full facepiece.
1,000	Any pressure-demand supplied-air respirator equipped with a half-mask
<ol style="list-style-type: none"> <li>1. The protection offered by a given respirator is contingent upon (1) the respirator user adhering to complete program requirements (such as the ones required by OSHA in 29CFR 1910.134), (2) the use of NIOSH-certified respirators in their approved configuration, and (3) individual fit testing to rule out those respirators that cannot achieve a good fit on individual workers.</li> <li>2. ## 11. Toxicological Information

### Acute effects of exposure:

**Inhalation:** Inhalation of dust may cause respiratory tract irritation. Symptoms of exposure may include cough, sore throat, nasal congestion, sneezing, wheezing and shortness of breath. **Ingestion:** Ingestion in an unlikely route of exposure. If dust is swallowed, it may irritate the mouth and throat. **Skin contact:** No adverse effects are expected. **Eye contact:** Particulates may cause abrasive injury.

**Chronic effects:** Prolonged inhalation of respirable crystalline silica may cause lung disease, silicosis, lung cancer and other effects.

The method of exposure that can lead to the adverse health effects described below is inhalation.

**A. SILICOSIS can exist in several forms, chronic (or ordinary), accelerated, or acute:**

Chronic or Ordinary Silicosis is the most common form of silicosis, and can occur after many years (10 to 20 or more) of prolonged repeated inhalation of relatively low levels of airborne respirable crystalline silica dust. It is further defined as either simple or complicated silicosis. Simple silicosis is characterized by lung lesions (shown as radiographic opacities) less than 1 centimeter in diameter, primarily in the upper lung zones. Often, simple silicosis is not associated with symptoms, detectable changes in lung function or disability. Simple silicosis may be progressive and may develop into complicated silicosis or progressive massive fibrosis (PMF). Complicated silicosis or PMF is characterized by lung lesions (shown as radiographic opacities) greater than 1 centimeter in diameter. Complicated silicosis or PMF symptoms, if present, are shortness of breath and cough. Complicated silicosis or PMF may be associated with decreased lung function and may be disabling. Advanced complicated silicosis or PMF may lead to death. Advanced complicated silicosis or PMF can result in heart disease secondary to the lung disease (cor pulmonale).

Accelerated Silicosis can occur with prolonged repeated inhalation of high concentrations of respirable crystalline silica over a relatively short period; the lung lesions can appear within five (5) years of initial exposure. Progression can be rapid. Accelerated silicosis is similar to chronic or ordinary silicosis, except that lung lesions appear earlier and progression is more rapid.

Acute Silicosis can occur after the repeated inhalation of very high concentrations of respirable crystalline silica over a short time period, sometimes as short as a few months. The symptoms of acute silicosis include progressive shortness of breath, fever, cough, weakness and weight loss. Acute silicosis is fatal.

**B. CANCER IARC** - The International Agency for Research on Cancer ("IARC") concluded that "crystalline silica in the form of quartz or cristobalite dust is carcinogenic to humans (Group 1)". For further information on the IARC evaluation, see IARC Monographs on the Evaluation of Carcinogenic Risks to Humans, Volume 100C, "A Review of Human Carcinogens: Arsenic, Metals, Fibers and Dusts " (2011).

NTP classifies "Silica, Crystalline (respirable size)" as Known to be a human carcinogen.

**C. AUTOIMMUNE DISEASES** Several studies have reported excess cases of several autoimmune disorders -- scleroderma, systemic lupus erythematosus, rheumatoid arthritis -- among silica-exposed workers.

**D. TUBERCULOSIS** Individuals with silicosis are at increased risk to develop pulmonary tuberculosis, if exposed to tuberculosis bacteria. Individuals with chronic silicosis have a three-fold higher risk of contracting tuberculosis than similar individuals without silicosis.

**E. KIDNEY DISEASE** Several studies have reported excess cases of kidney diseases, including end stage renal disease, among silica exposed workers. For additional information on the subject, the following may be consulted: "Kidney Disease and Silicosis", Nephron, Volume 85, pp. 14-19 (2000).

**F. NON-MALIGNANT RESPIRATORY DISEASES** The reader is referred to Section 3.5 of the NIOSH Special Hazard Review cited below for information concerning the association between exposure to crystalline silica and chronic bronchitis, emphysema and small airways disease. There are studies that disclose an association between dusts found in various mining occupations and non-malignant respiratory diseases, particularly among smokers. It is unclear whether the observed associations exist only with underlying silicosis, only among smokers, or result from exposure to mineral dusts generally (independent of the presence or absence of crystalline silica, or the level of crystalline silica in the dust).

Sources of information: The NIOSH Hazard Review - Occupational Effects of Occupational Exposure to Respirable Crystalline Silica published in April 2002 summarizes and discusses the medical and epidemiological literature on the health risks and diseases associated with occupational exposures to respirable crystalline silica. The NIOSH Hazard Review is available from NIOSH - Publications Dissemination, 4676 Columbia Parkway, Cincinnati, OH 45226, or through the NIOSH web site, [www.cdc.gov/niosh/topics/silica](http://www.cdc.gov/niosh/topics/silica), then click on the link "NIOSH Hazard Review: Health Effects of Occupational Exposure to Respirable Crystalline Silica".

For a more recent review of the health effects of respirable crystalline silica, the reader may consult Fishman's Pulmonary Diseases and Disorders, Fourth Edition, Chapter 57. "Coal Workers' Lung Diseases and Silicosis".

Finally, the US Occupational Safety and Health Administration (OSHA) published a summary of respirable crystalline silica health effects in connection with OSHA's Proposed Rule regarding occupational exposure to respirable crystalline silica. The summary was published in the September 12, 2013 Federal Register, which can be

**Eye/face Protection:**

Do not get in eyes.  
Wear chemical splash safety goggles.  
Wear full face respirator for eye protection if exposures are likely to exceed the Short Term Exposure Limit or significant liquid splash potential exists.  
Ensure that eyewash stations and safety showers are close to the workstation location.  
A respirator is not needed under normal and intended conditions of product use as defined under Engineering Controls.

**Skin Protection:**

Do not get on skin or clothing.  
Wash thoroughly after handling.  
Ensure that eyewash stations and safety showers are close to the workstation location.

**Hands:**

Wear gloves that cannot be penetrated by chemical or oil.  
The correct choice of protective gloves depends upon the chemicals being handled, the conditions of work and use, and the condition of the gloves (even the best chemically resistant glove will break down after repeated chemical exposures).  
Most gloves provide only a short time of protection before they must be discarded and replaced.  
Because specific work environments and material handling practices vary, safety procedures should be developed for each intended application.  
Gloves should therefore be chosen in consultation with the supplier/manufacturer and with a full assessment of the working conditions.

**Respiratory Protection:**

Use only with adequate ventilation.  
Wear special protective clothing and a full face respirator or a positive pressure, self-contained breathing apparatus(SCBA). Keep container closed.

**Other protection:**

Ensure that eyewash stations and safety showers are close to the workstation location.

**Hygiene Measures:**

Wash hands after handling this material and before eating, smoking, using lavatory and at the end of the day.  
Ensure that eyewash stations and safety showers are close to the workstation location.

Repeated dose toxicity - Rat - male and female - Oral - 2 yr - NOAEL (No observed adverse effect level) - 100 mg/kg - LOAEL (Lowest observed adverse effect level) - 334 mg/kg  
Remarks: (ECHA)

Animal feeding studies in rat, mouse and dog, at high doses, have demonstrated effects on fertility and testes. Studies with the chemically related boric acid in the rat, mouse and rabbit, at high doses, demonstrate developmental effects on the fetus, including fetal weight loss and minor skeletal variations. The doses administered were many times in excess of those to which humans would normally be exposed. Human epidemiological studies show no increase in pulmonary disease in occupational populations with chronic exposures to boric acid dust and sodium borate dust. A recent epidemiological study under

the conditions of normal occupational exposure to borate dusts indicated no effect on fertility.

To the best of our knowledge, the chemical, physical, and toxicological properties have not been thoroughly investigated.
